

# nSHIELD- Use case description: Railway security

## The context and architecture

Rail-based mass transit systems are vulnerable to many criminal acts, ranging from vandalism to terrorism. Therefore, physical security systems for infrastructure protection comprises all railway assets as for tunnel, train on board, platform and public areas, external Areas, technical control room, depots, electrical substations and etc...

The objectives are to forecast critical threats as: aggressions and abnormal behaviours, sabotage and terrorism, vandalism and graffiti, thefts and pickpocketing.

A modern smart-surveillance system suitable for the protection of urban or regional railways is made up by the following subsystems:

1. Intrusion detection and access control:
  - volumetric sensors for motion detection;
  - magnetic contacts to detect illicit doors opening;
  - glass break detectors;
  - microphonic cables for fence/grill vibration detection;
  - active infrared barriers for detecting intrusions inside the tunnels;
2. Intelligent video-surveillance and Intelligent sound detection:
  - advanced cameras with special features;
  - digital video processing and recording, using efficient data compression protocols;
  - video-analytics of the scenes, using computer vision algorithms;
  - Microphones.
3. Dedicated communication network
4. Integrated management system

Distributed smart-sensors are installed along the railway line both in fixed (e.g. bridges, tunnels, stations, etc.) and mobile (passenger trains, freight cars, etc.) locations (Figure 1).

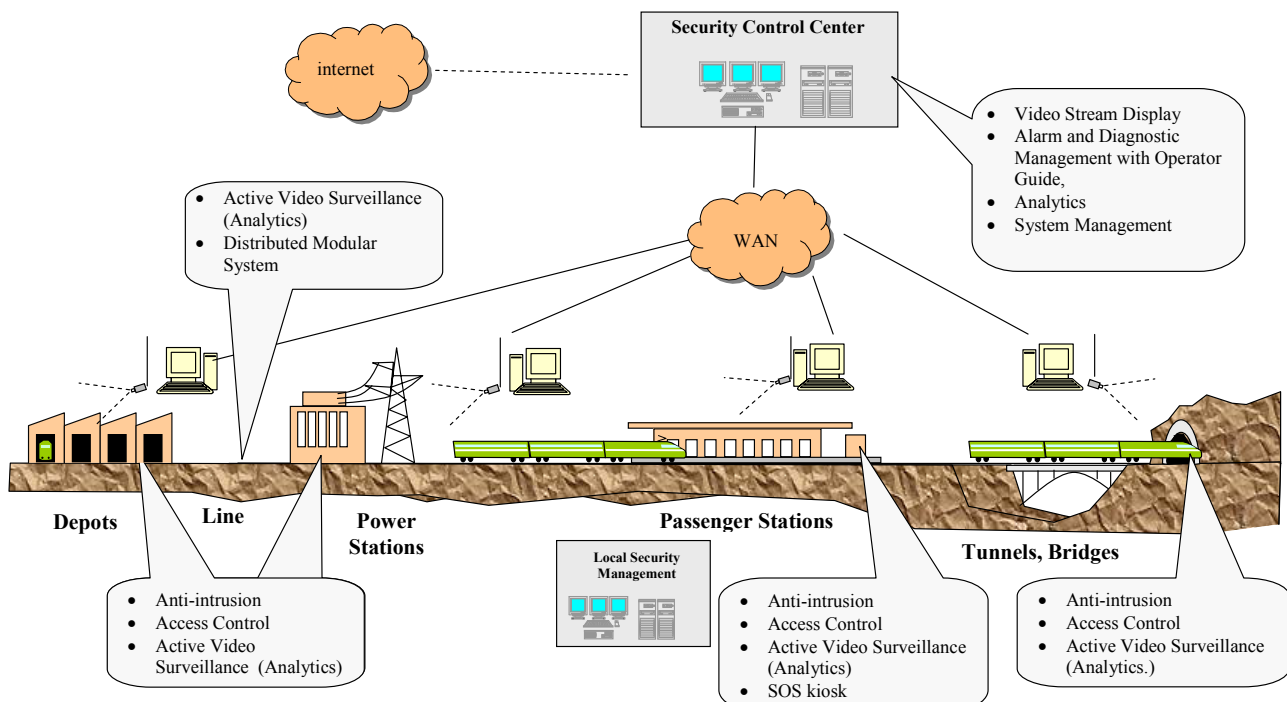

Figure 1 The monitoring architecture

They are integrated locally using local wireless infrastructures (e.g. Wi-Fi, ZigBee, etc.) and then data is collected by WSN gateway nodes and transmitted remotely by means of WAN (Wide Area Network). Low/average bandwidth networks are strictly required to transmit alarms to the control center, which are often already available (like GSM-R for railways) or easy to deploy (like satellite) and provide an extensive coverage of the infrastructure. However, if high-quality video streams from cameras need to be shown to the operators in order to verify the alarm and/or supervise the situation, higher bandwidth is required which can be possibly achieved by multiple low bandwidth connections.

This system are already been designed by Ansaldo STS for metro railways, where heterogeneous intrusion detection, access control, intelligent video-surveillance and abnormal sound detection devices are integrated in a cohesive Security Management System (SMS), figure 2.

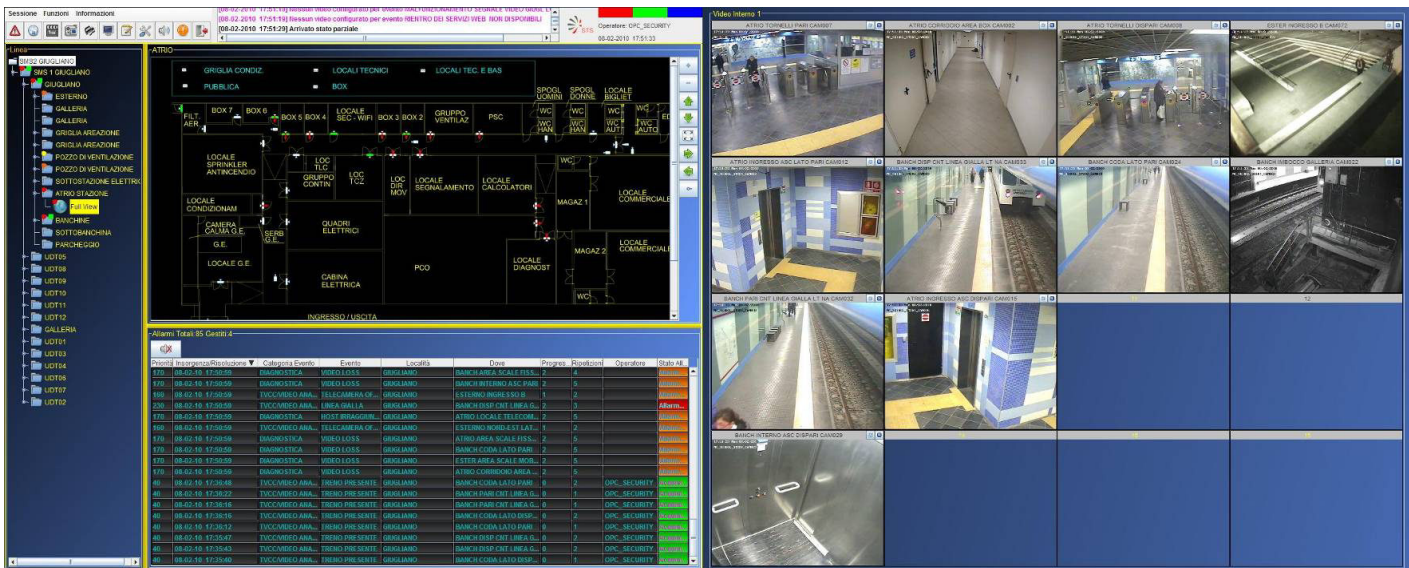

Figure 2 SMS-Security Management System GUI

The core of the SMS consists of a web-based software application featuring a graphical user interface. System architecture is distributed and hierarchical, with both local and central control rooms collecting alarms according to different scopes and responsibilities. In case of emergencies, the procedural actions required to the operators involved are orchestrated by the SMS. Redundancy both in sensor dislocation and hardware apperals (e.g. by local or geographical clustering) improve detection reliability, through alarm correlation, and overall system resiliency against both random and malicious threats. Video-analytics is essential, since a small number of operators would be unable to visually control the large number of cameras which are needed to extensively cover all the areas needing to be protected. Therefore, the visualization of video streams is activated automatically when an alarm is generated by smart-cameras or other sensors, following an event-driven approach. Very high resolution cameras installed close to the turnstiles are used to automatically detect and store the faces of passengers, whose database can be accessed for post-event investigations. Real-time communication between the on-board and the ground is allowed by a wide-band wireless network.

## Needs and problems

Currently, the security system described above is highly heterogeneous in terms not only of detection technologies (which will remain such) but also of embedded computing power and communication facilities. In other words, sensors differ in their inner hardware-software architecture and thus in the capacity of providing information security and dependability. This causes several problems:

- Information security must be provided according to different mechanisms and on some links - which are not “open” but still vulnerable to attacks - information is not protected by cryptographic nor vitality-checking protocols;
- Whenever any new sensor needs to be integrated into the system, a new protocol and/or driver must be developed and there is no possibility of directly evaluating the impact of such integration on the overall system dependability;
- New dedicated and completely segregated network links often need to be employed in order not to make the sensor network exposed to information related threats;
- The holistic assurance and evaluation of dependability parameters (e.g. for assessment/certification purposes) would be a very difficult task.

In particular both natural and malicious faults can impact on system availability and indirectly on safety, since the SMS is adopted in critical infrastructure surveillance applications.

The problems mentioned above can be solved by adopting the nSHIELD architecture. Cohesion will be assured by wrapping sensors of any nature with homogeneous embedded hardware and software providing information security, by e.g.:

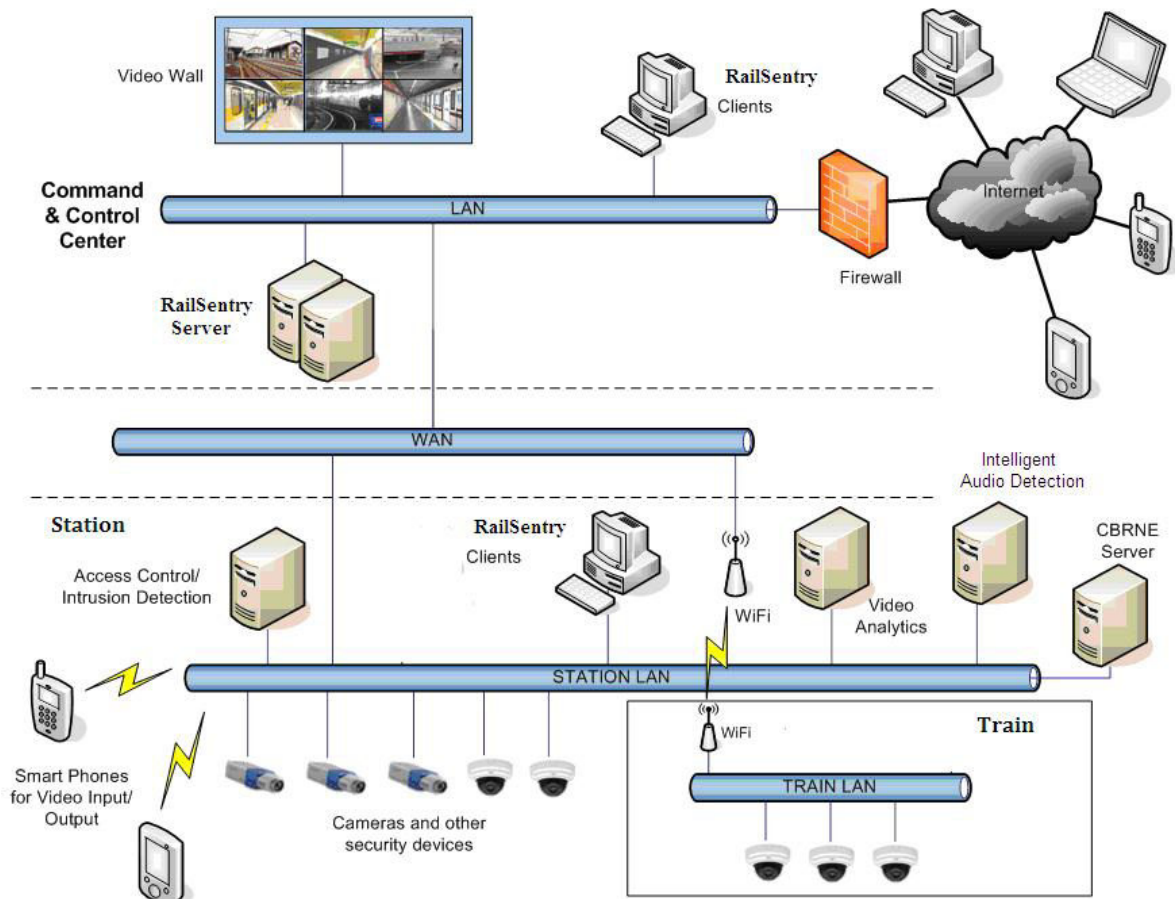

- Cryptographic protocols
- Vitality checking (heartbeat/watchdog timers based on sequence numbers and time-stamping)

The mechanisms provided by nSHIELD would mitigate the effects on the system of the following logical threats:

- Repetition (a message is received more than once)
- Deletion (a message is removed from a message stream)
- Insertion (a new message is implanted in the message stream)
- Re-sequencing (messages are received in an unexpected sequence)
- Corruption (the information contained in a message is changed, casually or not)
- Delay (messages are received at a time later than intended)
- Masquerade (a non-authentic message is designed thus to appear to be authentic)

Some sensing devices will be converted into smart-sensors by integrating the sensor unit with the nSHIELD processing units (both hardware and software) at the node level. The sensor networks will be integrated by the nSHIELD middleware before data is collected by the SMS and used at the presentation level (integration and reasoning).

Typically, the monitoring system is composed by different sensors (IP-cameras, microphones, anti-intrusion device, etc... ). They are connected through different communication networks and several topologies to a data center. The data center is connected to commad and control center. In figure is showed a typical architecture.

**Figure 3 System Security architecture**

The sensors collect information about asset and send them to the Security Management Systems (SMS).

The security system is composed by different sub-systems such as: video-surveillance, anti-intrusion detection, smart-audio surveillance. Signals coming from different sub-systems are elaborate in order to detect the corresponding events.

The video-surveillance sub-system is able to guarantee both traditional functionalities (video stream management from different cameras, digital recording) and automatic video-analytics (motion detection, motion tracking) in order to manage critical events in the station.

The anti-intrusion sub system and access control detect non-authorized access to protected sites (depots, Technical control rooms, etc..) . The elaboration servers are able to recognize false alarms with the use of different type of technologies.

The smart-audio-surveillance Sub-systems is able to:

- Detect abnormal sound corresponding to vandalism, aggressions, etc...
- Identify the place in which happens this acts.

All sub-systems are connected through dedicated and completely segregated network links. .Instead, real-time communication between the on-board and the ground is allowed by a wide-band wireless network.

## Risk Analysis

Risk analysis will be used for evaluation of SPD risk in the nSHIELD railway security scenario.

Is possible to approach with the following steps:

- Define asset/component;
- For each asset/component will be identified the threat (T);
- For each T identified will be defined:
  - Likelihood (P): expected probability of occurrence of T (i.e. how probable is the threat);
  - Vulnerability (V): expected vulnerability with respect to T (i.e. how probable is it that T will cause the expected consequences);
  - Consequences (D): expected damage caused by T (i.e. an estimation of consequences caused by the threat);
  - calculate risk (R):  $R = P \cdot V \cdot D$ .

For likelihood, vulnerability and consequences evaluation is adopted a qualitative technique.

Qualitative evaluation use reduced scales of values of intuitive meaning, for instance: Low, Medium, High. The advantage is that estimations can be more straightforward and computations easier. The disadvantage is that results are usually less rigorous and the combination of qualitative indices questionable.

The  $P \cdot V$  factor is compacted into a single factor, which – to avoid confusion – we will define here as the frequency F of “successful” threats. Hence:

$$F = P \cdot V$$

The F evaluation is conducted through an associative matrix:

**Table 1 Qualitative frequency evaluation using associative matrix**

P	V	Low	Medium	High
Low		Low	Low	Medium
Medium		Low	Medium	High
High		Medium	High	High

Qualitative risk evaluation uses associative matrix reported below using the estimated values of F and D:

**Table 2 Qualitative Risk evaluation using associative matrix**

PV	D	Low	Medium	High
Low		Low	Low	Medium
Medium		Low	Medium	High
High		Medium	High	High

Based on this information is possible to identify the mean element of architecture to protect and possible threats for Railroad Security scenario. In table 1 are showed some components and relative risk analysis:

Assets to protect	Threats	Vulnerability (V)	Likelihood (P)	Consequences (D)	Risk R=P xV x D
<b>Ethernet Camera</b>	Physical tamper/manumission such as: <ul style="list-style-type: none"> <li>• Cable disconnection;</li> <li>• Theft</li> <li>• Significant movement or replacement</li> <li>• Other relevant damage meant to put the unit out of order</li> </ul>	HIGH	HIGH	LOW	MEDIUM
<b>Analog Microphone</b>		If they are located in a public c area.		Operation of the single sensor is compromised, as the related monitoring functionality. The easy diagnosability of the attack reduces its impact	
<b>Ethernet Camera</b>	HW fault: <ul style="list-style-type: none"> <li>• Loss of component functionality</li> <li>• Loss of sensor functionality</li> </ul>	MEDIUM	HIGH	MEDIUM	HIGH
<b>Wi-Fi Camera</b>		In general HW and SW are vulnerable, especially after some operation time, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of related monitoring functionality. It is difficult to diagnose	
<b>Mote WSN</b>	SW fault: <ul style="list-style-type: none"> <li>• Bug</li> <li>• Aging</li> <li>• Transient fault</li> </ul>				
<b>Ethernet Camera</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>• Network overload</li> <li>• Involuntary disconnection</li> </ul>	MEDIUM	MEDIUM	LOW	LOW
<b>Wi-Fi Camera</b>		It depends on environmental condition, bandwidth, capacity of connection, number of sensors	It depends on network architecture.	Communication of the single sensor is compromised, as the related monitoring functionality. The easy diagnosability of the fault reduces its impact	
<b>Mote WSN</b>	Unauthorized network access	LOW	LOW	HIGH	MEDIUM
<b>Ethernet Camera</b>		Data destruction	Connection are wired and encrypted	The attacker take the control of communication and he can alterate the data of sensors and relative alarms. It is difficult to diagnose.	
		It depends on attacker ability.			
<b>Wi-Fi Camera</b>	Physical tamper/manumission, such as: <ul style="list-style-type: none"> <li>• Theft</li> <li>• Significant movement or replacement</li> <li>• Any other relevant damage meant to put the unit completely out of order</li> </ul>	HIGH	MEDIUM	MEDIUM	HIGH
<b>Mote WSN</b>		If they are located in a public c area.		Operation of the single sensor is compromised, as the related monitoring functionality. The easy diagnosability of the attack reduces its impact	
<b>Wi-Fi Camera</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>• Interferences with electromagnetic device</li> </ul>	HIGH	LOW	LOW	LOW
<b>Mote WSN</b>		The connection are wireless	It depends of network architecture.	Operation of the single sensor is compromised, as the related monitoring functionality. The easy diagnosability of the fault reduces its impact	
<b>Wi-Fi Camera</b>	Unauthorized network access	MEDIUM	MEDIUM	HIGH	HIGH
<b>Mote WSN</b>	Data destruction	Connection are wireless but can be encrypted		The attacker take the control of communication and he can alterate the data of sensors and related alarms. It is difficult to diagnose.	
<b>Ethernet Camera</b>	Data alteration	MEDIUM	MEDIUM	HIGH	HIGH
<b>Wi-Fi Camera</b>		Connections can be encrypted		The attacker takes control of communication and he/she can modify the data of sensors and related alarms. It is difficult to diagnose.	
<b>Mote WSN</b>	Data Sniffing	LOW	MEDIUM	HIGH	MEDIUM
<b>Ethernet Camera</b>		Connection is wired	It requires physical access to cable connection.		
<b>Wi-Fi Camera</b>	Data Sniffing	HIGH	HIGH	HIGH	HIGH
<b>Mote WSN</b>		Connection is wireless	It requires equipments available commercially		

<b>Analog Microphone</b>	HW fault: <ul style="list-style-type: none"> <li>Loss of component functionality</li> <li>Involuntary disconnection</li> </ul>	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some operation time, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of related monitoring functionality. It is difficult to diagnose	
<b>Wi-Fi Camera</b>	Transmitted data scrambling (e.g. high- power microwave generators)	HIGH	LOW	MEDIUM	MEDIUM
<b>Mote WSN</b>			It requires equipments not available commercially	Since it can affect a large number of sensors located in the same area.	
<b>Anti-intrusion sensor (via serial loop through proprietary protocol)</b>	Physical tamper/manumission such as: <ul style="list-style-type: none"> <li>Cable disconnection;</li> <li>Theft</li> <li>Significant movement or replacement</li> <li>Other relevant damage meant to put the unit out of order</li> </ul>	HIGH	MEDIUM	HIGH	HIGH
		If they are located in a public c area.		Operation of the single sensor is compromised, as the related monitoring functionality. The easy diagnosability of the attack reduces its impact	
<b>Anti-intrusion sensor (via serial loop through proprietary protocol)</b>	HW fault: <ul style="list-style-type: none"> <li>Loss of component functionality</li> <li>Involuntary disconnection</li> </ul> SW fault: <ul style="list-style-type: none"> <li>Bug</li> <li>Aging</li> <li>Transient fault</li> </ul>	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some operation time, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of related monitoring functionality. It is difficult to diagnose	
<b>Anti-intrusion sensor (via serial loop through proprietary protocol)</b>	HW fault: <ul style="list-style-type: none"> <li>Loss of component functionality</li> <li>Involuntary disconnection</li> </ul>	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some times, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of related monitoring functionality. It is difficult to diagnose	
<b>Application server</b>	Random corruption of data	MEDIUM	LOW	HIGH	MEDIUM
	Loss of data integrity	It depends on redundant/fault-tolerant components.	It depends on how much the HW is reliable/ruggedized and on environmental conditions (e.g. air conditioning).	Effects range from loss of specific functions to loss of a whole (sub)system.	
<b>Application server</b>	Physical tamper/manumission such as: <ul style="list-style-type: none"> <li>Cable disconnection;</li> <li>Theft</li> <li>Significant movement or replacement</li> <li>Other relevant damage meant to put the unit out of order</li> </ul>	LOW	LOW	HIGH	MEDIUM
		The servers are in technical control room	The servers are in technical control room	The monitoring application is compromised	
<b>Application server</b>	Unauthorized network access	MEDIUM	MEDIUM	HIGH	HIGH
	Sniffing	The network is connect to the Internet. Using firewalls reduces vulnerability	Nowadays attempts to attack public utility servers are not rare	Once accessed by the attackers, the servers are completely under their control, and furthermore the attack can be difficult to detect.	
<b>Application server</b>	Transmitted data scrambling (e.g. high-temperature generators, fault of air conditioning)	LOW	MEDIUM	HIGH	MEDIUM
		The servers are in technical control room	It requires equipments available commercially.	Since it can affect a large number of servers located in the same area. The monitoring application is compromised	
<b>Application server</b>	HW fault: <ul style="list-style-type: none"> <li>Loss of component functionality</li> <li>Loss of server functionality</li> </ul> SW fault: <ul style="list-style-type: none"> <li>Bug</li> <li>Aging</li> <li>Transient fault</li> </ul>	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some operation time, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of related monitoring functionality. It is difficult to diagnose	

<b>Application server</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>• Network overload</li> <li>• Involuntary disconnection</li> </ul>	MEDIUM	LOW	HIGH	LOW
		It depends on environmental condition, bandwidth, capacity of connection, number of servers	It depends of network architecture.	Operation of the server is compromised, as the whole monitoring system.	
<b>Emergency button</b>	HW fault	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some times, to this fault.	It depends on HW and SW robustness and environmental condition.	Loss of alert functionality	
<b>Emergency button</b>	Physical tamper/manumission such as: <ul style="list-style-type: none"> <li>• Cable disconnection;</li> <li>• Destruction</li> </ul>	LOW	MEDIUM	MEDIUM	MEDIUM
				Loss of alert functionality	
<b>Client operator/video wall</b>	HW fault: <ul style="list-style-type: none"> <li>• Loss of component functionality</li> <li>• Loss of video functionality</li> </ul> SW fault: <ul style="list-style-type: none"> <li>• Bug</li> <li>• Aging</li> <li>• Transient fault</li> </ul>	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some times, to this fault.	It depends on HW and SW robustness and environmental condition.	Loss of specific functions functionality. It is easy to diagnose	
<b>Client operator/video wall</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>• Network overload</li> <li>• Involuntary disconnection</li> </ul>	MEDIUM	LOW	MEDIUM	MEDIUM
		It depends on environmental condition, bandwidth, capacity of connection.	It depends on network architecture.	Loss of specific functions functionality. It is easy to diagnose	
<b>Client operator/video wall</b>	Unauthorized network access <ul style="list-style-type: none"> <li>• Data disruption/alteration</li> <li>• Loop video</li> </ul>	LOW	LOW	HIGH	MEDIUM
		Connection are wired	It depends on attacker ability.	Difficult to diagnose	
<b>Mobile client (PDA, Smartphone, etc.) or remotely connected client (using Internet)</b>	HW fault: <ul style="list-style-type: none"> <li>• Loss of component functionality</li> <li>• Loss of client functionality</li> </ul> SW fault: <ul style="list-style-type: none"> <li>• Bug</li> <li>• Aging</li> <li>• Transient fault</li> </ul>	MEDIUM	MEDIUM	MEDIUM	MEDIUM
		In general HW and SW are vulnerable, especially after some times, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of alert function.	
<b>Mobile client</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>• Network overload</li> <li>• Involuntary disconnection</li> </ul>	MEDIUM	LOW	LOW	LOW
		It depends on environmental condition, bandwidth, capacity of connection.	It depends on network architecture.	Loss of alert functionality	
<b>Mobile client</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>• Interferences with electromagnetic</li> </ul>	MEDIUM	LOW	LOW	LOW
		The network is connect to the Internet. Using firewalls reduces vulnerability	It depends on network architecture.	Loss of alert functionality	
<b>Mobile client</b>	Unauthorized network access <ul style="list-style-type: none"> <li>• Data destruction/alteration</li> </ul>	MEDIUM	MEDIUM	HIGH	HIGH
		The network is connect to the Internet. Using firewalls reduces vulnerability	It depends on hacker ability.	Difficult to diagnose	
<b>Network Switch</b>	Physical tamper/manumission such as: <ul style="list-style-type: none"> <li>• Cable disconnection;</li> <li>• Theft</li> <li>• Other relevant damage meant to put the unit out of order</li> </ul>	LOW	LOW	HIGH	MEDIUM
		The switch are in technical control room		Loss of communication	
<b>Network Switch</b>	HW fault: <ul style="list-style-type: none"> <li>• Loss of component functionality</li> </ul>	MEDIUM	MEDIUM	HIGH	MEDIUM

	<ul style="list-style-type: none"> <li>Loss of switch functionality</li> </ul>	In general HW and SW are vulnerable, especially after some times, to this fault.	It depends on HW and SW robustness and environmental condition.	Loss of communication	
	SW fault: <ul style="list-style-type: none"> <li>Bug</li> <li>Aging</li> <li>Transient fault</li> </ul>				
<b>Network Switch</b>	MAC flooding	HIGH	MEDIUM	HIGH	HIGH
	Control of switch		Some security means can limit this threat (e.g. Port security.)	Loss of communication	
<b>Logical control unit for Anti-intrusion/Access Control via Ethernet</b>	Physical tamper/manumission such as: <ul style="list-style-type: none"> <li>Cable disconnection;</li> <li>Theft</li> <li>Significant movement or replacement</li> <li>Other relevant damage meant to put the unit out of order</li> </ul>	LOW	MEDIUM	HIGH	MEDIUM
		The Control Units are in technical control room		Loss of functionality	
<b>Logical control unit for Anti-intrusion/Access Control via Ethernet</b>	HW fault: <ul style="list-style-type: none"> <li>Loss of component functionality</li> <li>Loss of camera functionality</li> </ul>	MEDIUM	MEDIUM	HIGH	HIGH
	SW fault: <ul style="list-style-type: none"> <li>Bug</li> <li>Aging</li> <li>Transient fault</li> </ul>	In general HW and SW are vulnerable, especially after some times, to this fault.	It depends on HW and SW robustness and environmental condition.	Effects range from loss of specific functions to loss of related monitoring functionality.	
<b>Logical control unit for Anti-intrusion/Access Control via Ethernet</b>	Alteration of connection due to: <ul style="list-style-type: none"> <li>Network overload</li> <li>Involuntary disconnection</li> </ul>	MEDIUM	LOW	HIGH	MEDIUM
		It depends on environmental condition, bandwidth, capacity of connection.	It depends on network architecture.	Loss of functionality
