

NFV and SDN: The enablers for elastic networks

Kashif Mahmood,

Next Generation Network Technology (NGNT) Group, Telenor Research, Norway

UNIK Guest Lecture, 8th May 2014

Outline

- Challenges → What is coming
- The Network of today
- Elastic Networks → Way forward
- Enablers for Elastic networks → NFV / SDN
- Use cases
 - vCRAN
 - vEPC
 - vCDN
- Conclusion and Outlook

Outline

- Challenges → What is coming
- The Network of today
- Elastic Networks → Way forward
- Enablers for Elastic networks → NFV / SDN
- Use cases
 - vCRAN
 - vEPC
 - vCDN
- Conclusion and Outlook

Challenges: Video dominated exponential data growth

*Source : Ericson mobility report

■ Voice to data

*Traffic does not include DVB-H, Wi-Fi, or Mobile WiMax. Voice does not include VoIP.

Challenges: Video dominated exponential data growth

*Source : Ericson mobility report

- Voice to data
- Exponential data growth

*Traffic does not include DVB-H, Wi-Fi, or Mobile WiMax. Voice does not include VoIP.

Challenges: Video dominated exponential data growth

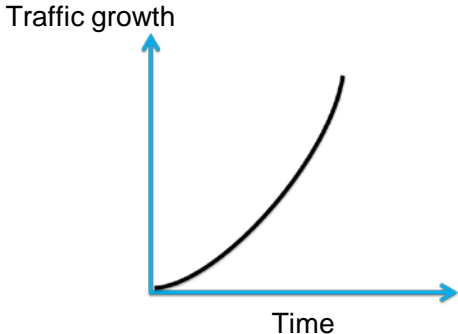

*Source : Ericson mobility report

- Voice to data
- Exponential data growth
- Mobile video traffic → 69% of data traffic by the end of 2018 ~CVI
 - Roughly a quarter of Netflix subscribers already streaming video to their smartphones, ~RCR Wireless

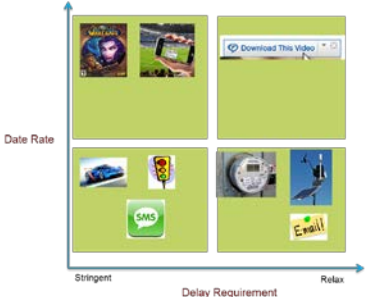

*Traffic does not include DVB-H, Wi-Fi, or Mobile WiMax. Voice does not include VoIP.

Challenges:

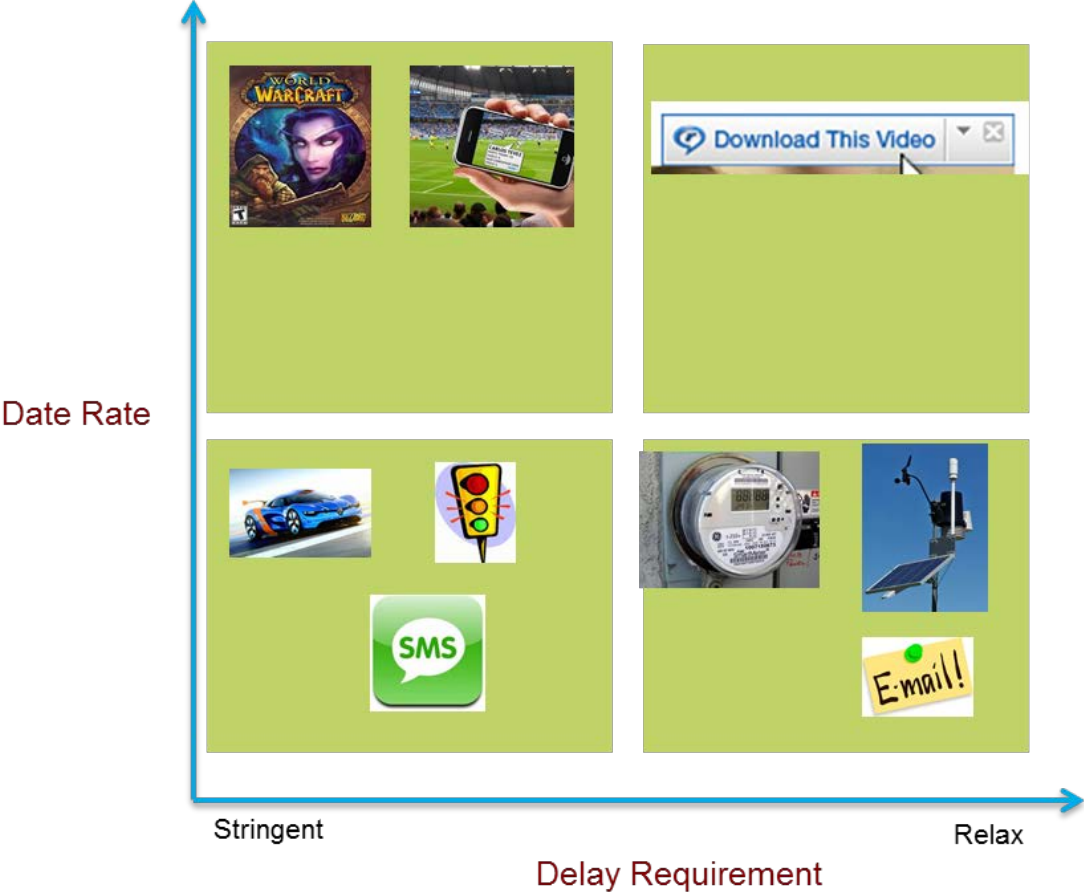

- Video dominated exponential data growth

- Diverse traffic

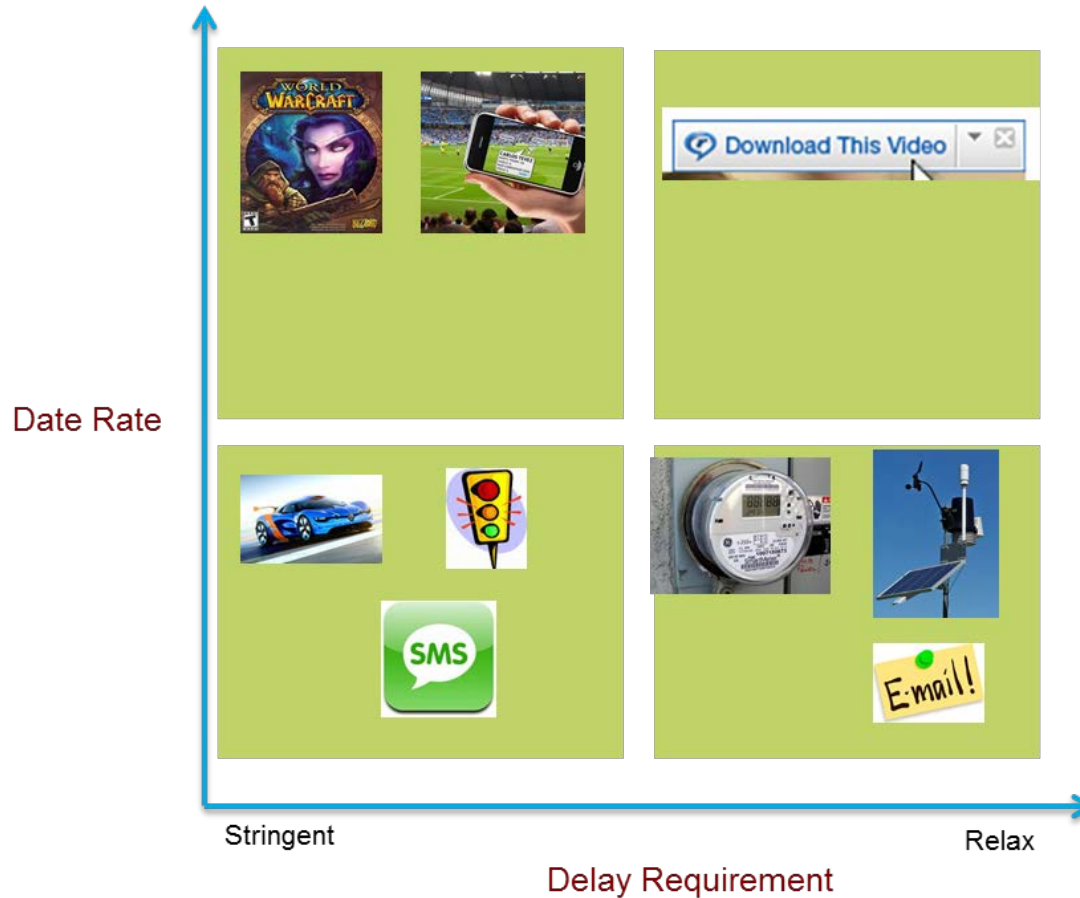

Challenges: Diverse traffic

- **Traffic type** : Emergency services, Machine to Machine, IoT ...
 - Signaling storm → “Always on” nature of mobile networks

Challenges: Diverse traffic

- **Traffic type** : Emergency services, Machine to Machine, IoT ...
 - Signaling storm → “Always on” nature of mobile networks

Challenges:

- Video dominated exponential data growth

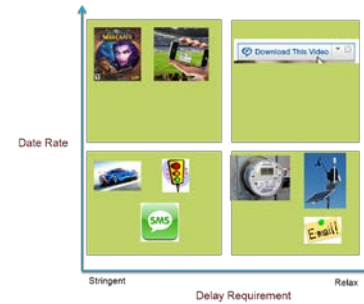

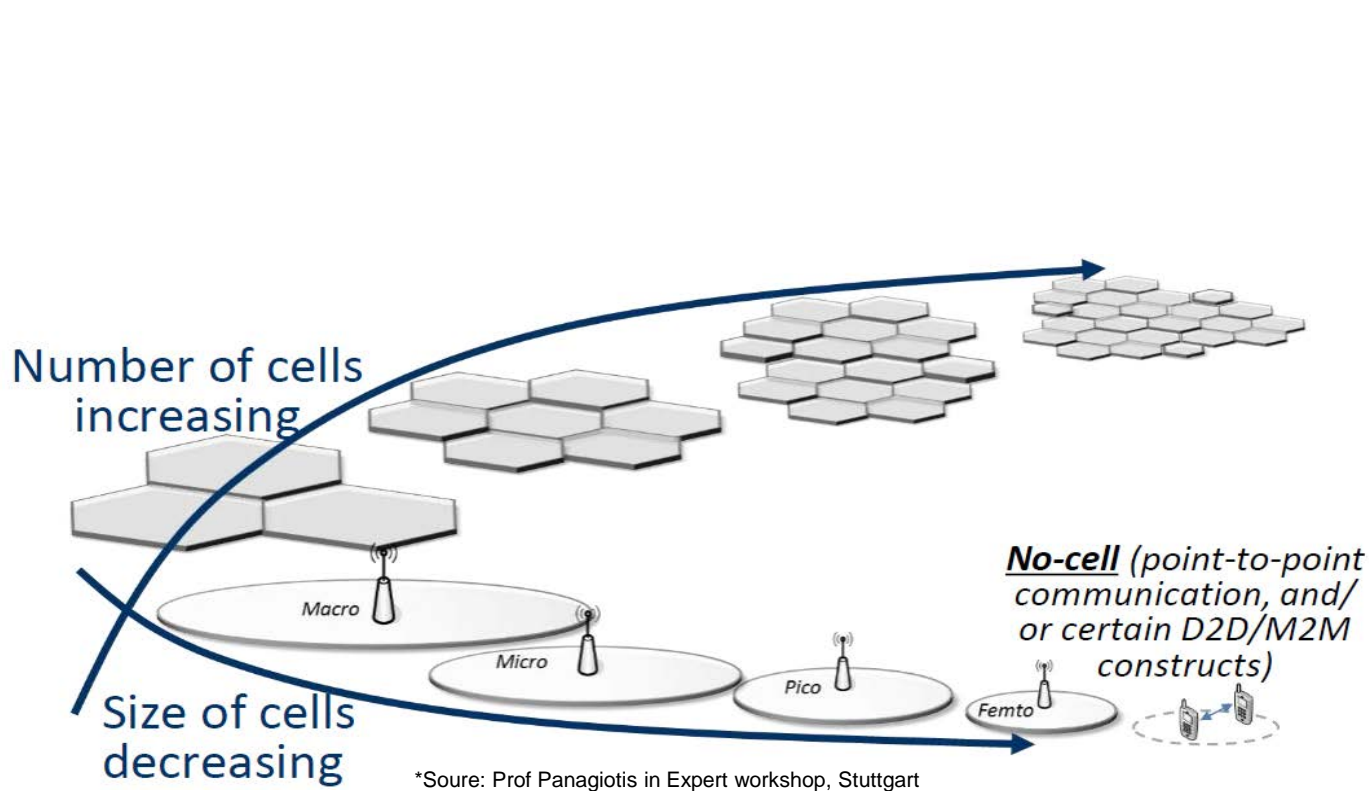

- Diverse traffic

- Ultra dense heterogeneous networks

Challenges: Ultra dense heterogeneous networks

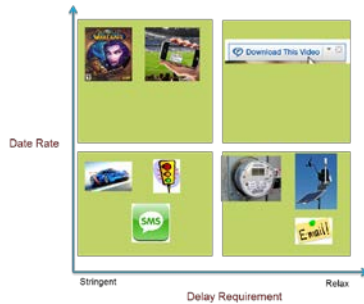

- 3-10 or more small cells per macro cells
- cells shrinking (from macro to no cell concept)

Challenges:

- Video dominated exponential data growth

- Diverse traffic

- Ultra dense heterogeneous networks

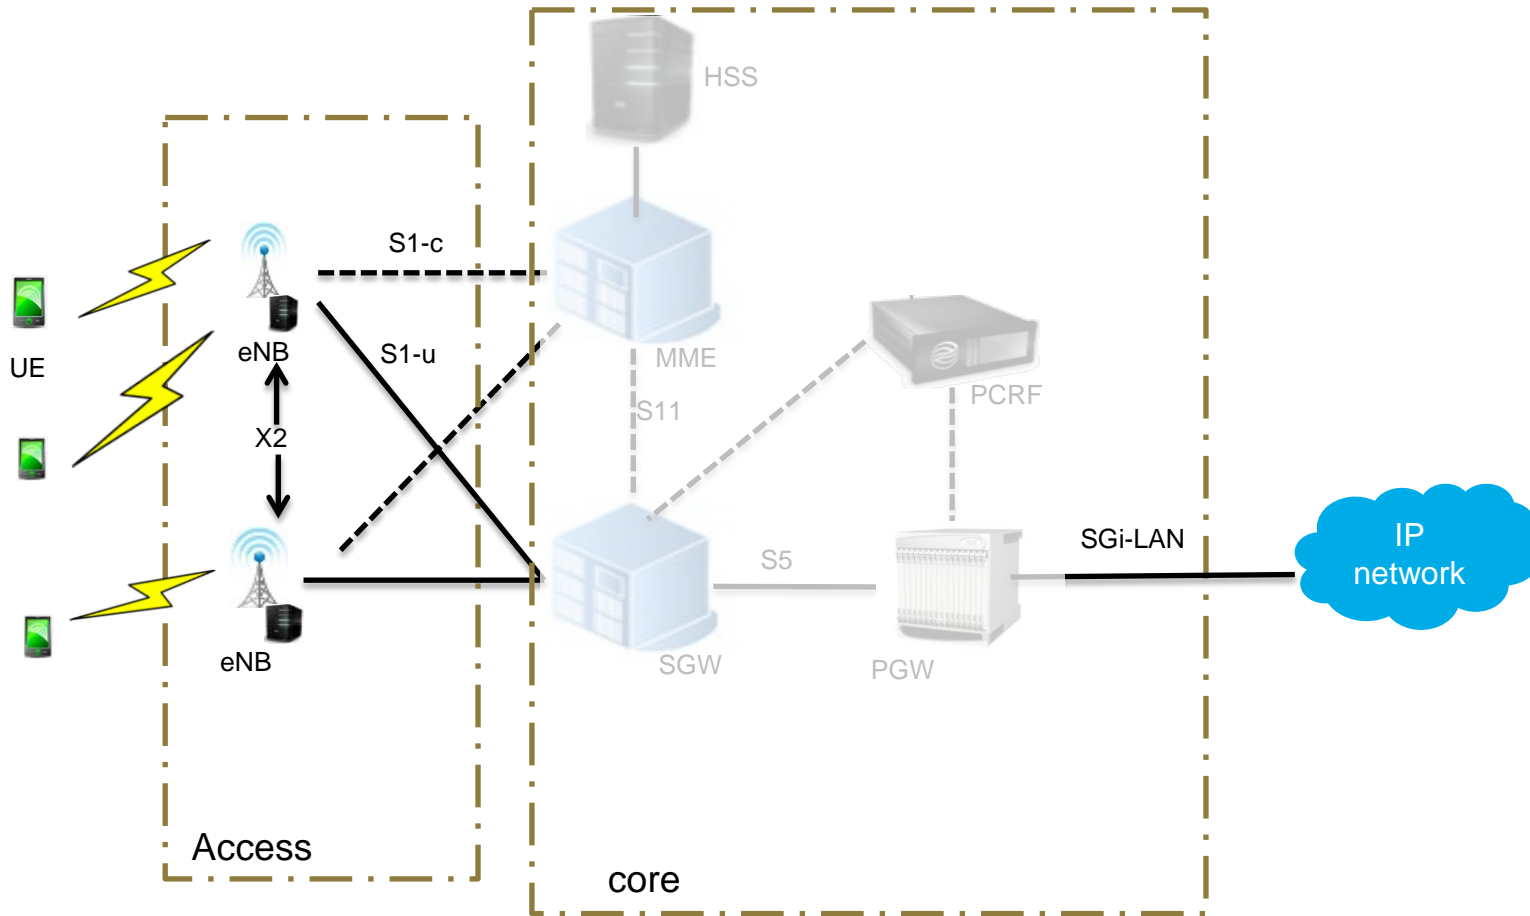

- No more competition on the basis of network coverage but on the basis of features and services.

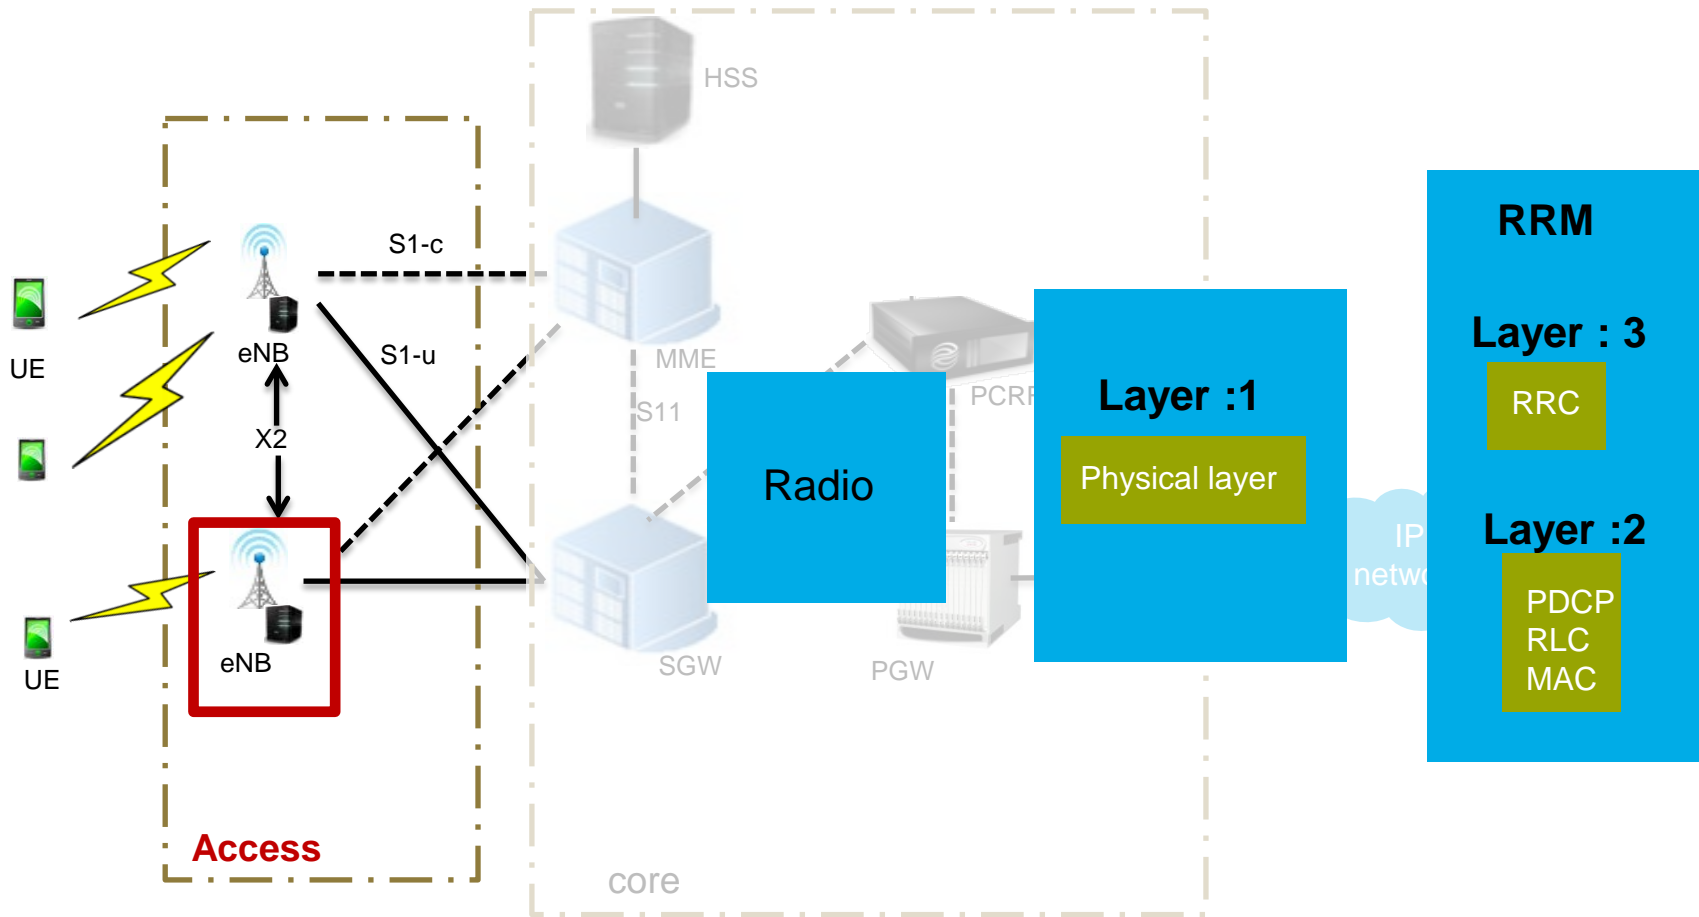

Outline

- Challenges → What is coming
- **The Network of today**
- Elastic Networks → Way forward
- Enablers for Elastic networks → NFV / SDN
- Use cases
 - vCRAN
 - vEPC
 - vCDN
- Conclusion and Outlook

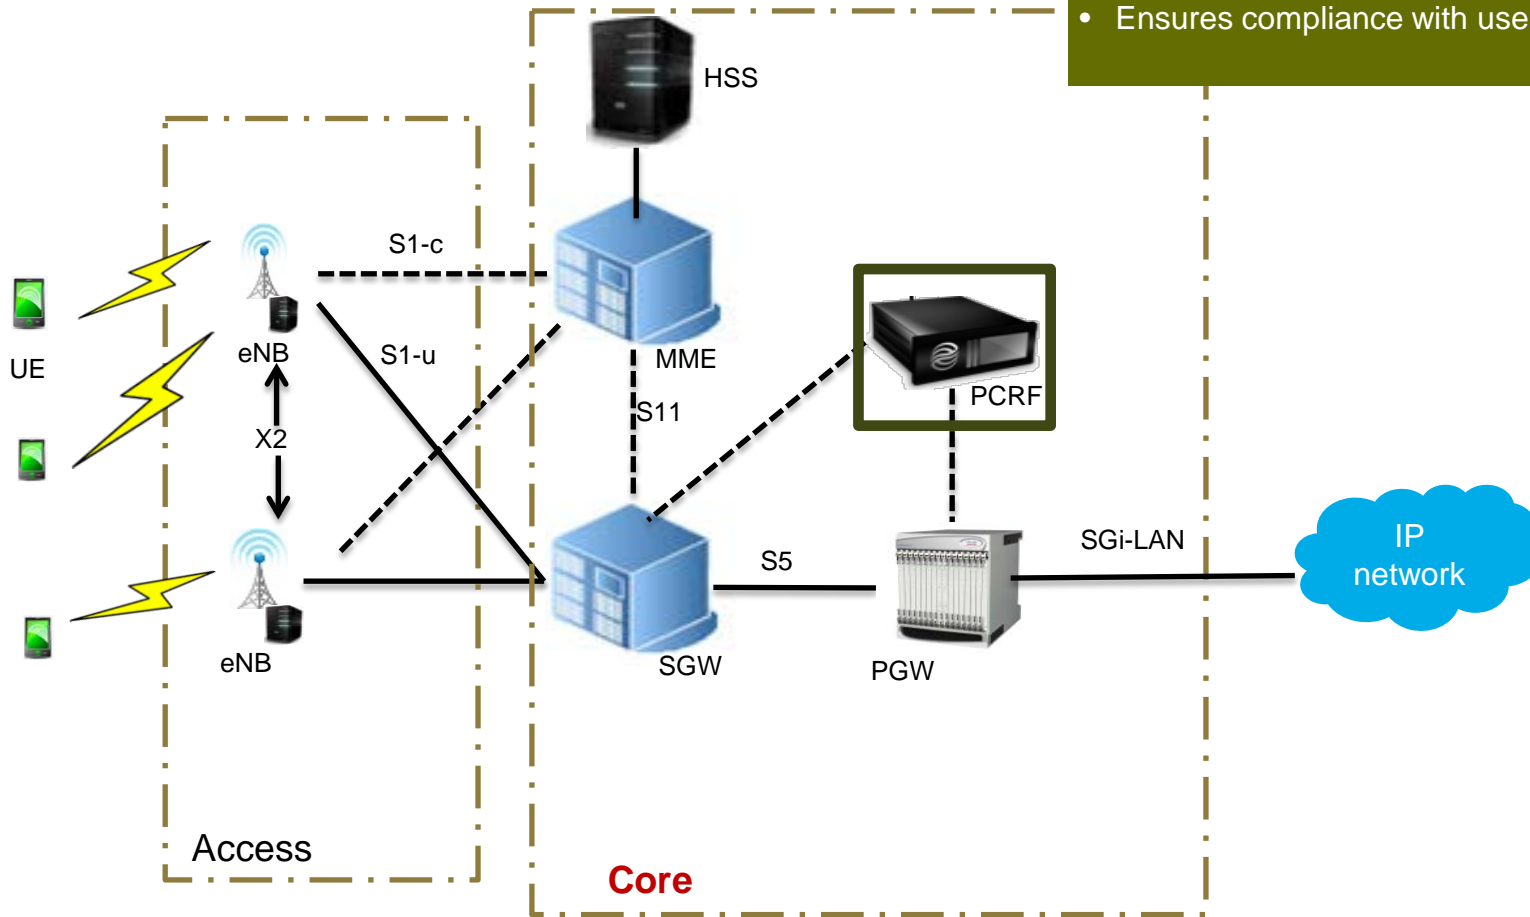

The Network of today

The Network of today

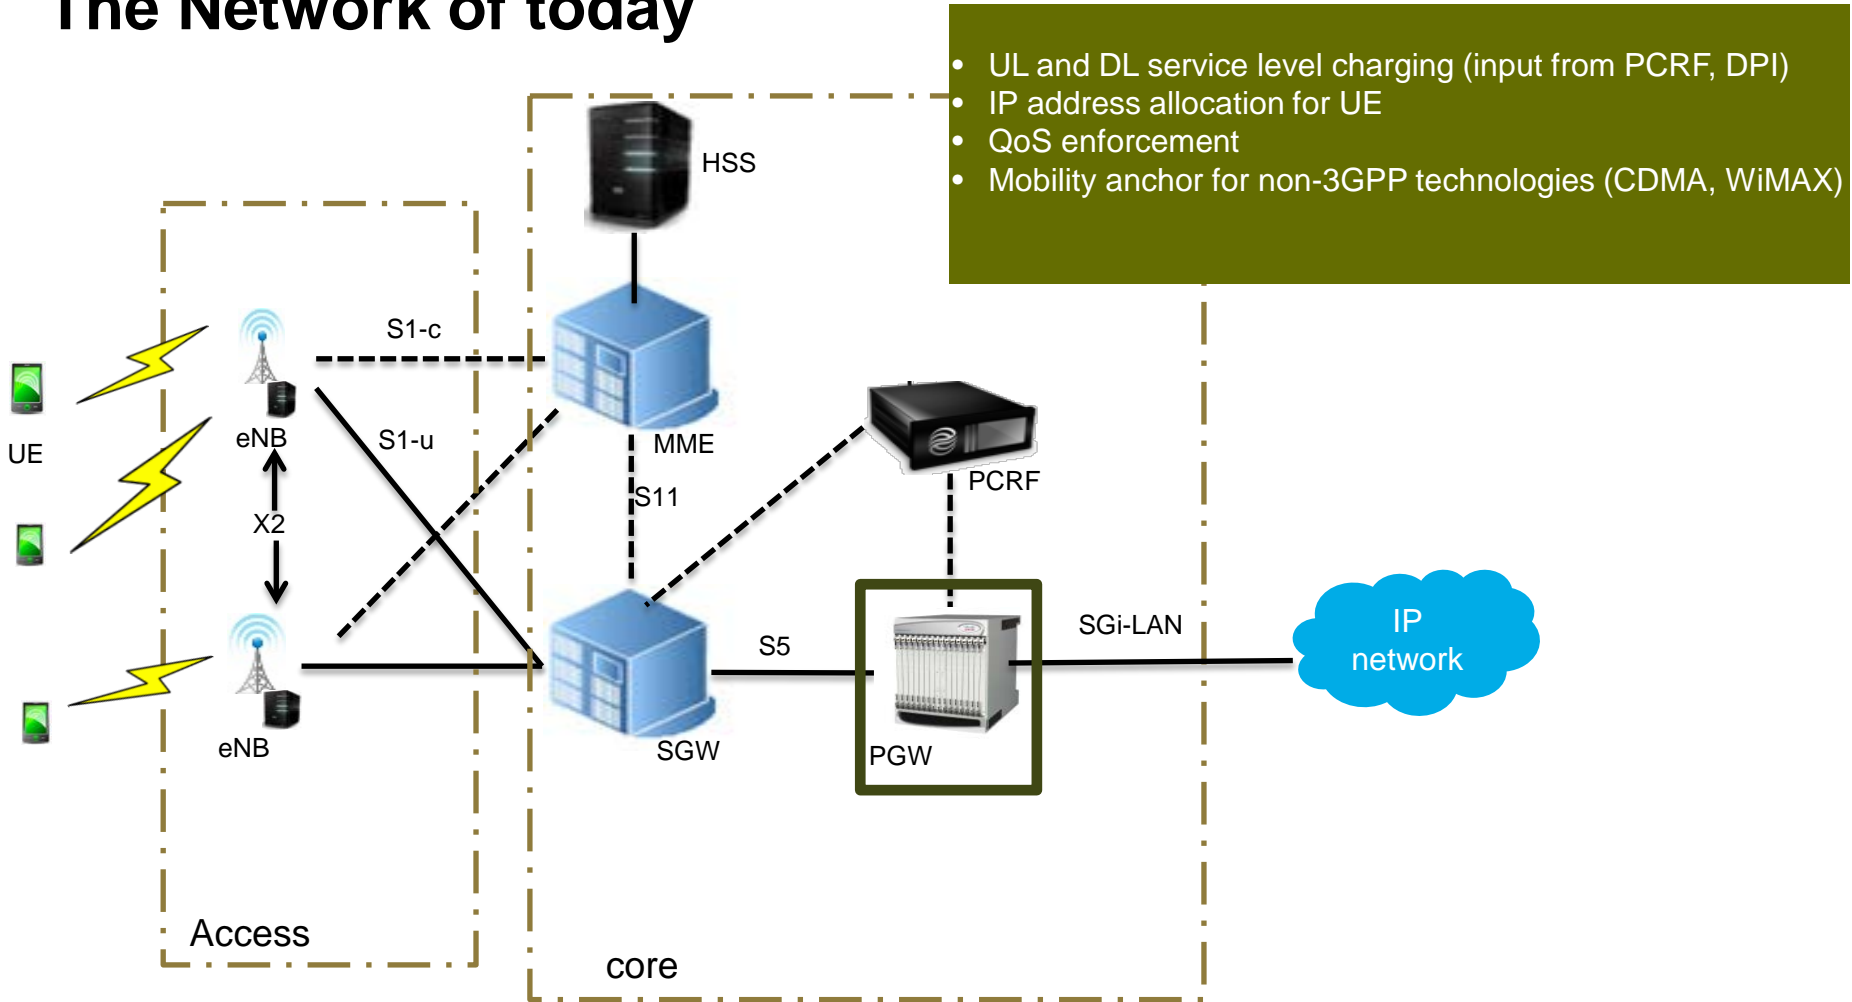

The Network of today

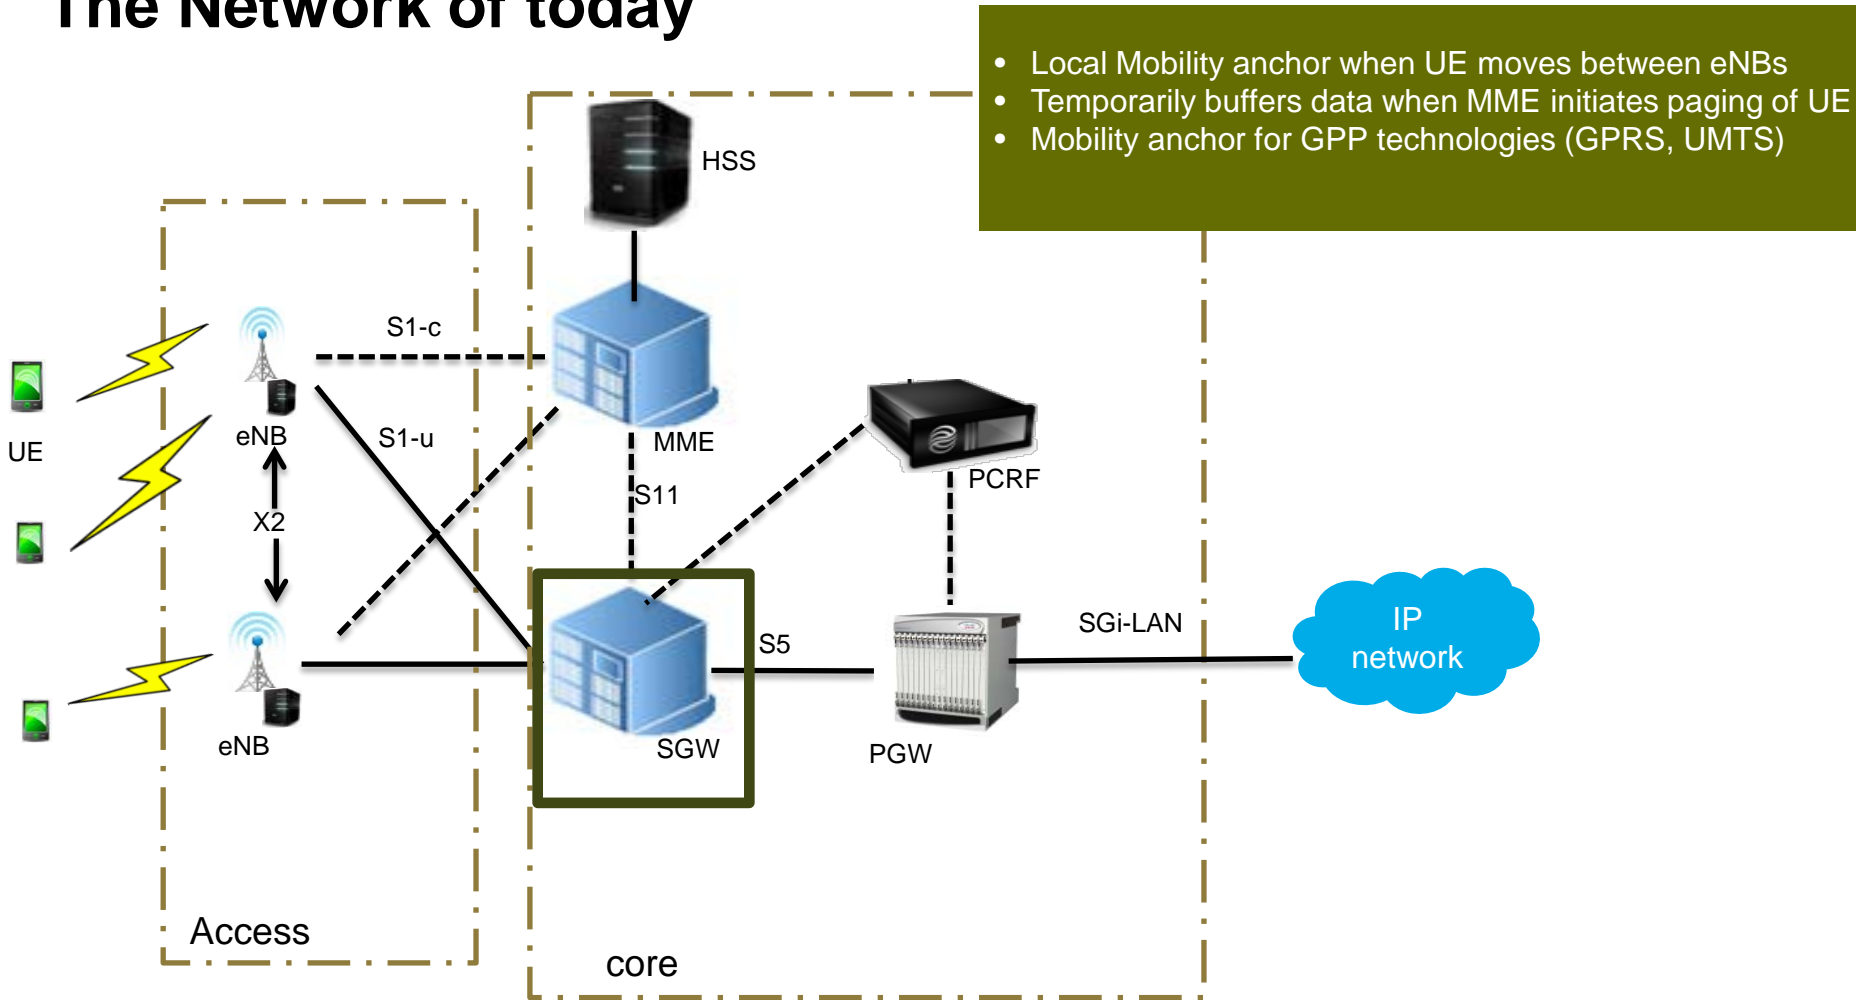

- Controls flow-based charging functionalities in PGW
- Ensures compliance with users subscription

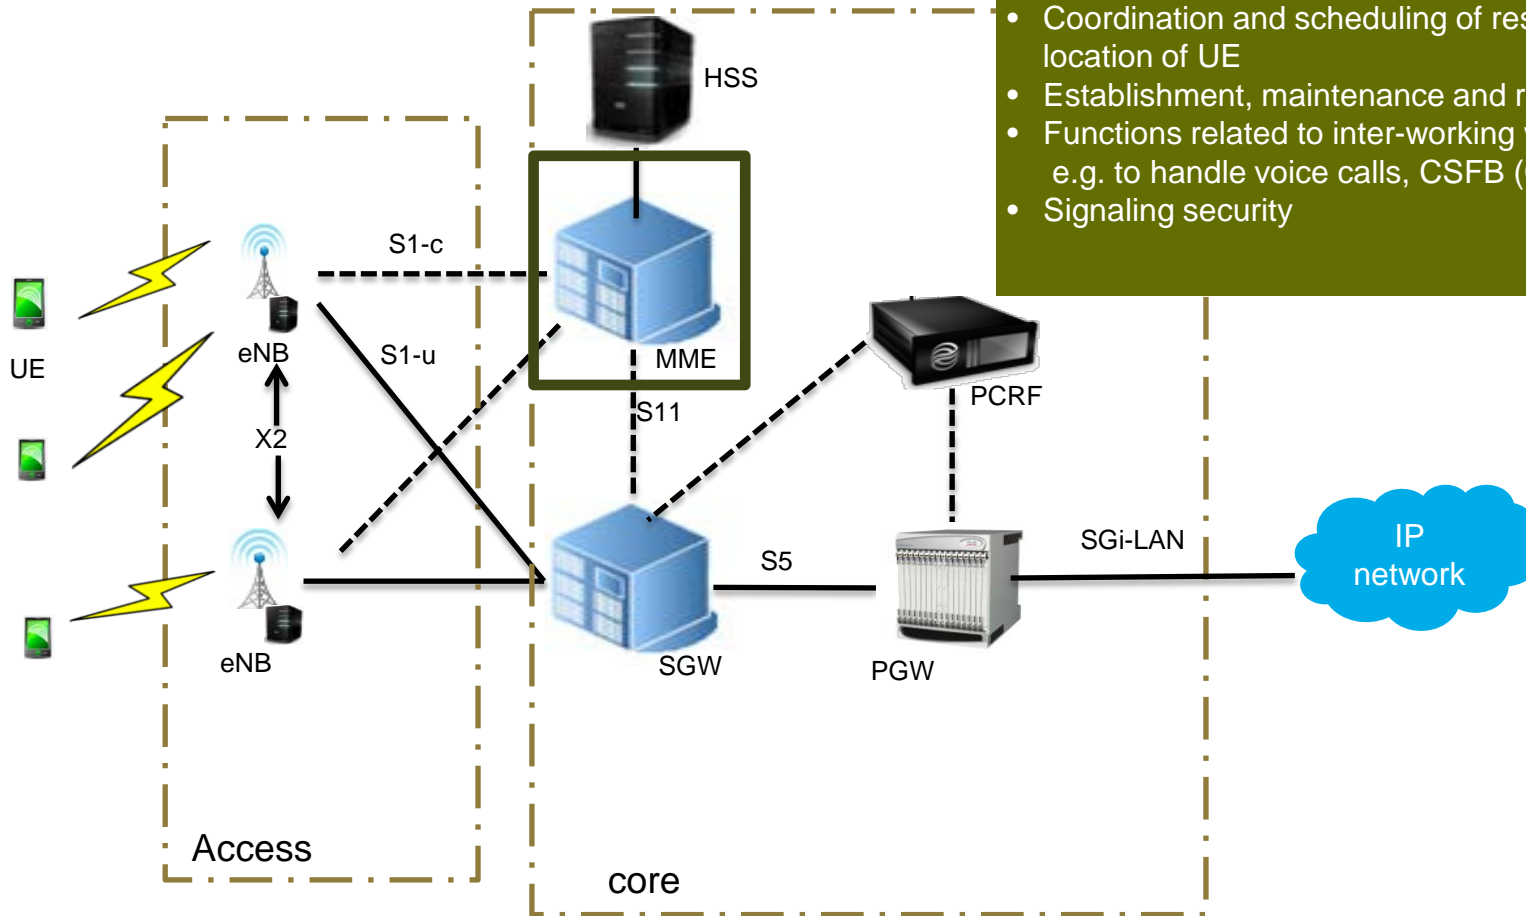

The Network of today

The Network of today

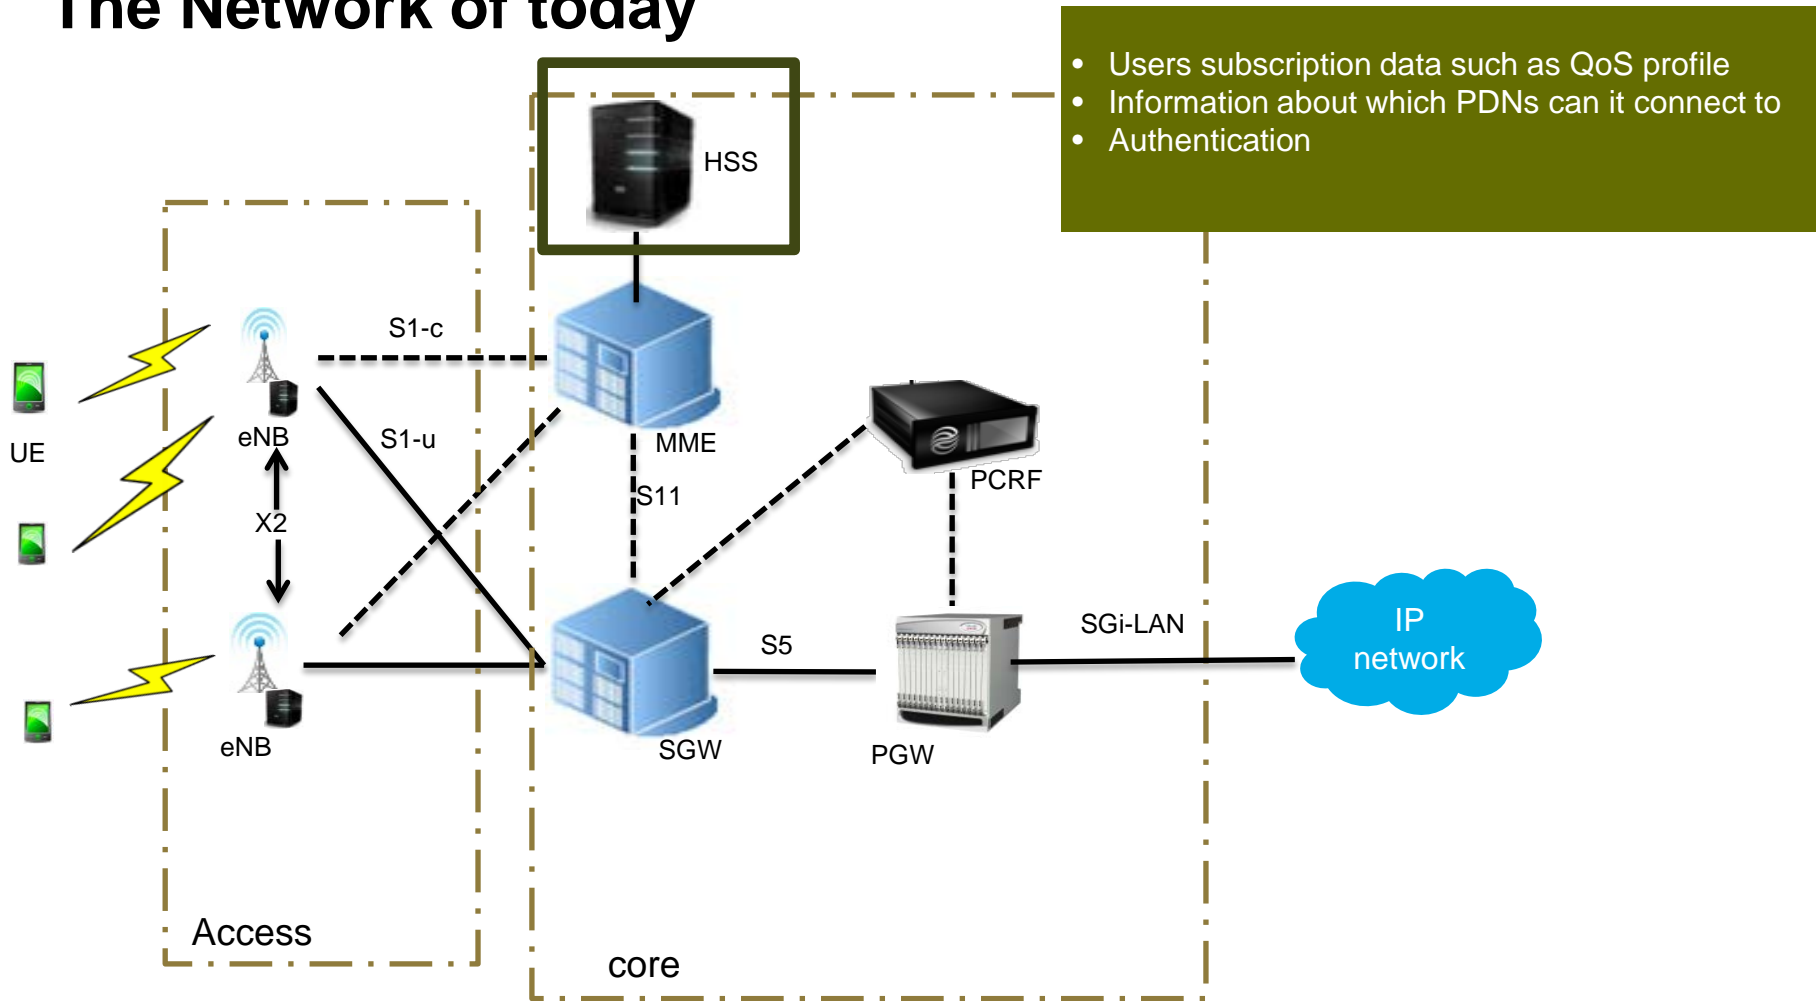

The Network of today

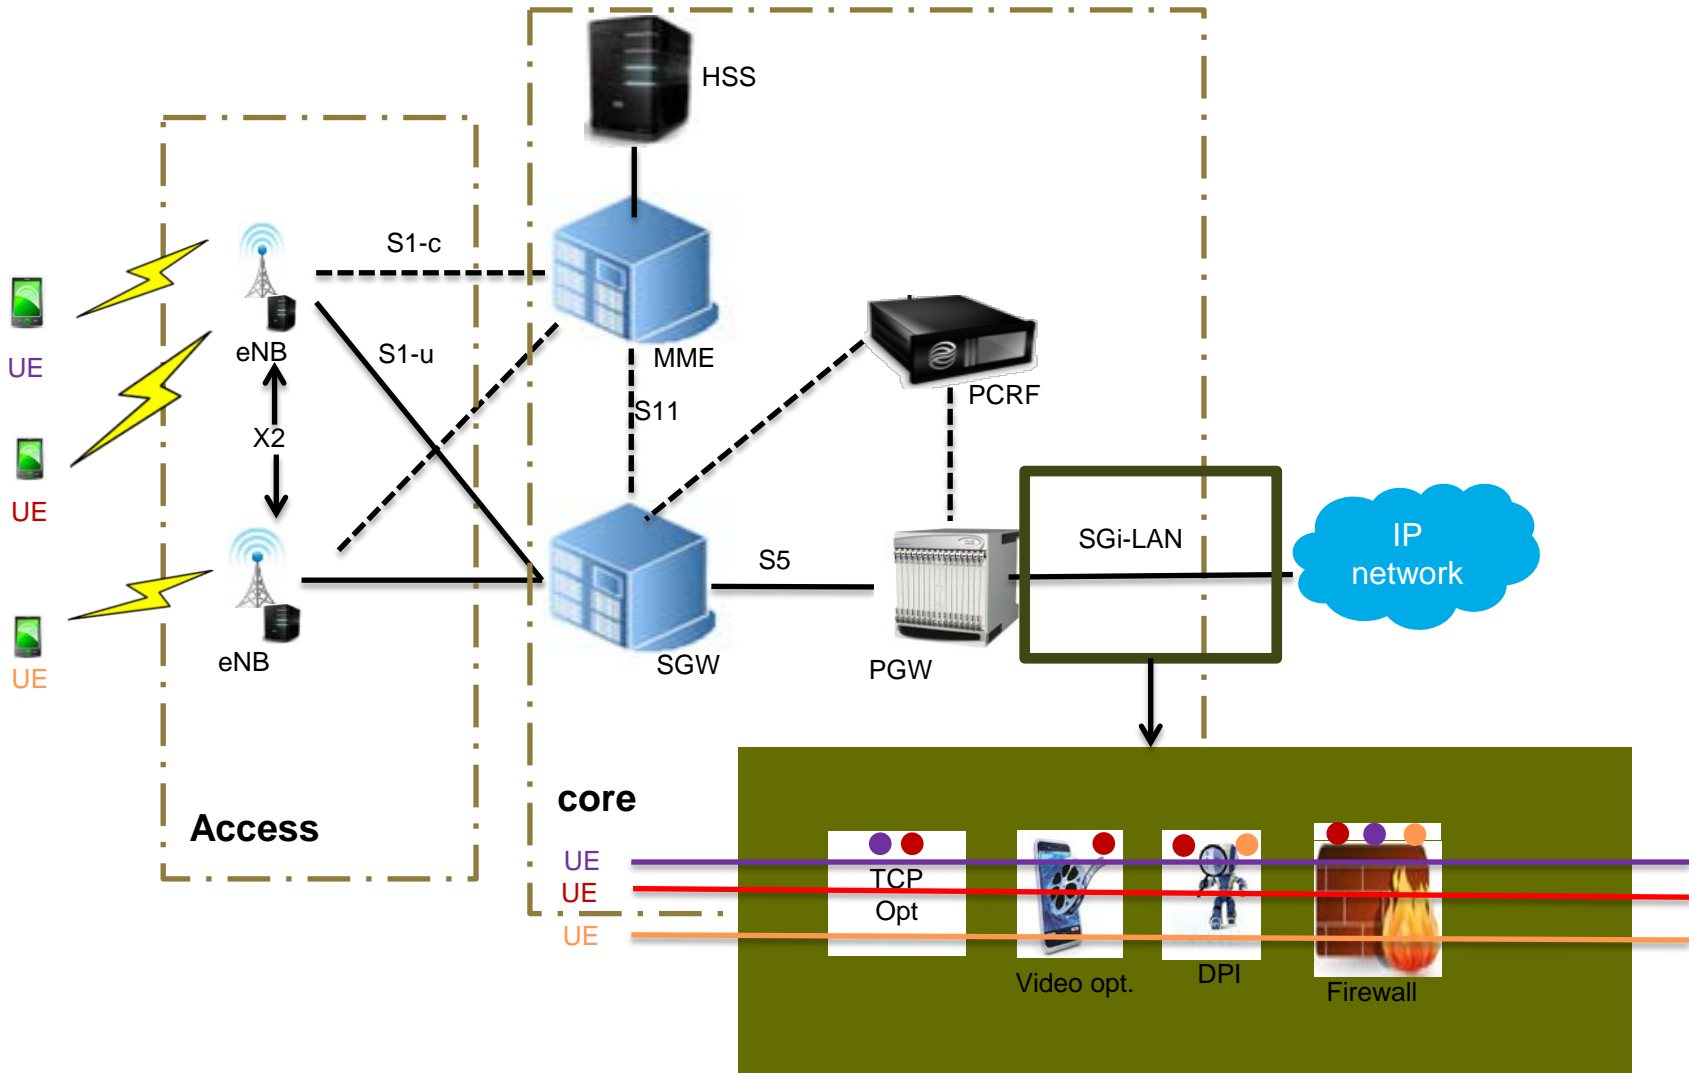

- Processes signaling between UE and core
- Coordination and scheduling of resources related to location of UE
- Establishment, maintenance and release of the bearers
- Functions related to inter-working with other networks e.g. to handle voice calls, CSFB (Circuit switch fall back)
- Signaling security

The Network of today

The Network of today

Characteristic of the Network of today

- Topologically fixed network nodes
- Many redundant functions repeated in each black box

- Takes a long time to roll out new services

- New services means new equipment

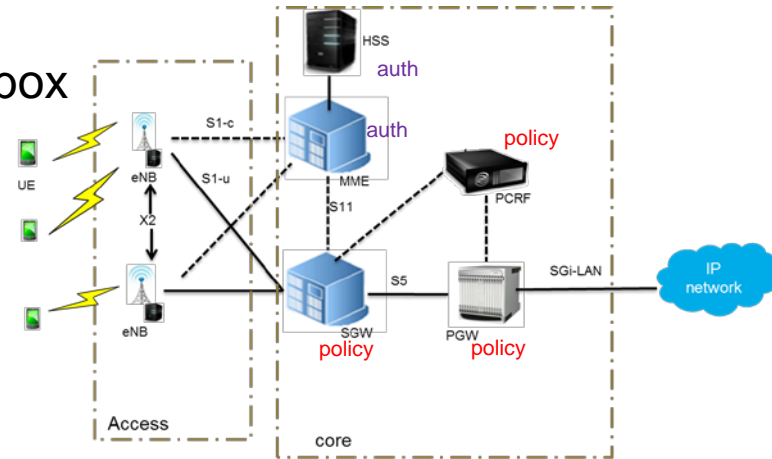

- NOT application aware.

- Statistics of the network difficult to obtain due to the distributed nature of network

- Control logic in each device → difficult to upgrade

- Designed for maximum load but traffic load is fluctuating

- 80% of base stations (BS) capacity and upto half of core networks capacity unused, ~SoftEPC, ICC'13

Enablers: NFV and SDN

*Trend from unstrung Pyramid research

Network function Virtualization (NFV)

- Network functions are implemented on virtual networks → VNFs
- Almost the same features but more flexibility.
- Uses custom of the shelf (COTS) equipment

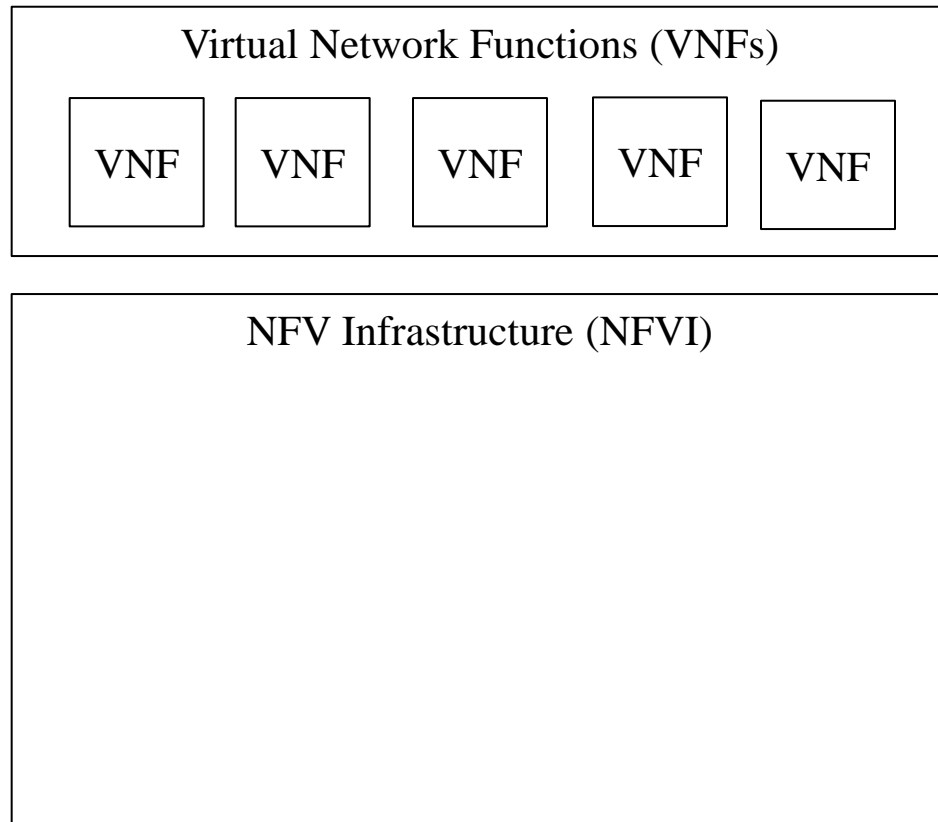

Architecture of network virtualization

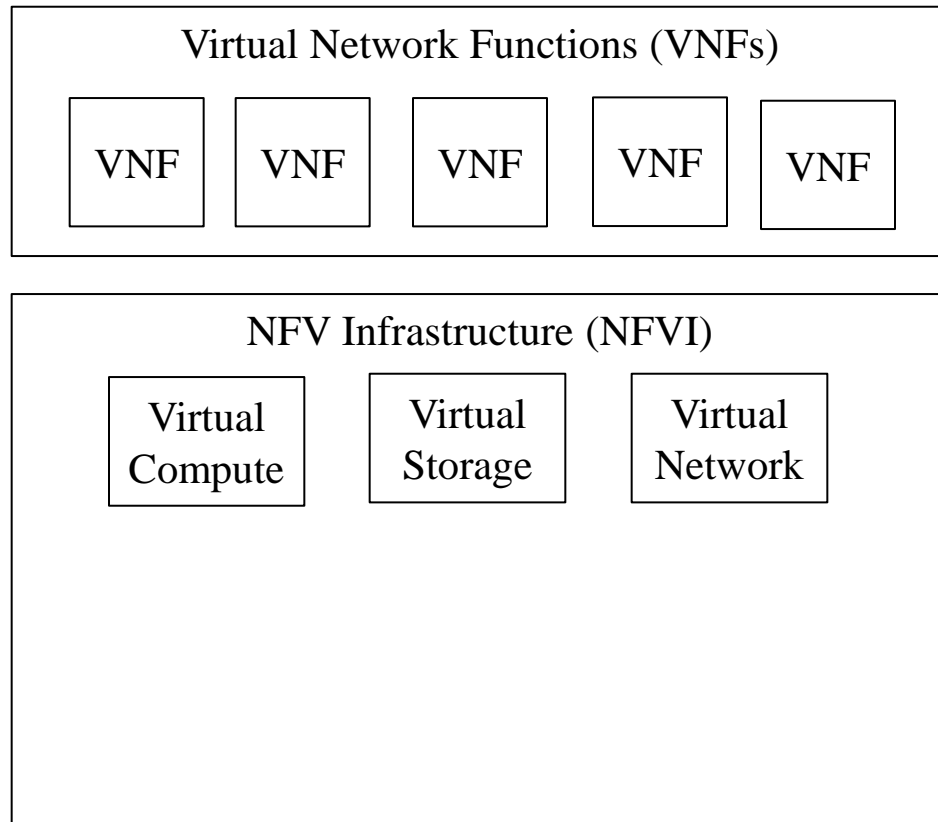

*source : ETSI

Architecture of network virtualization

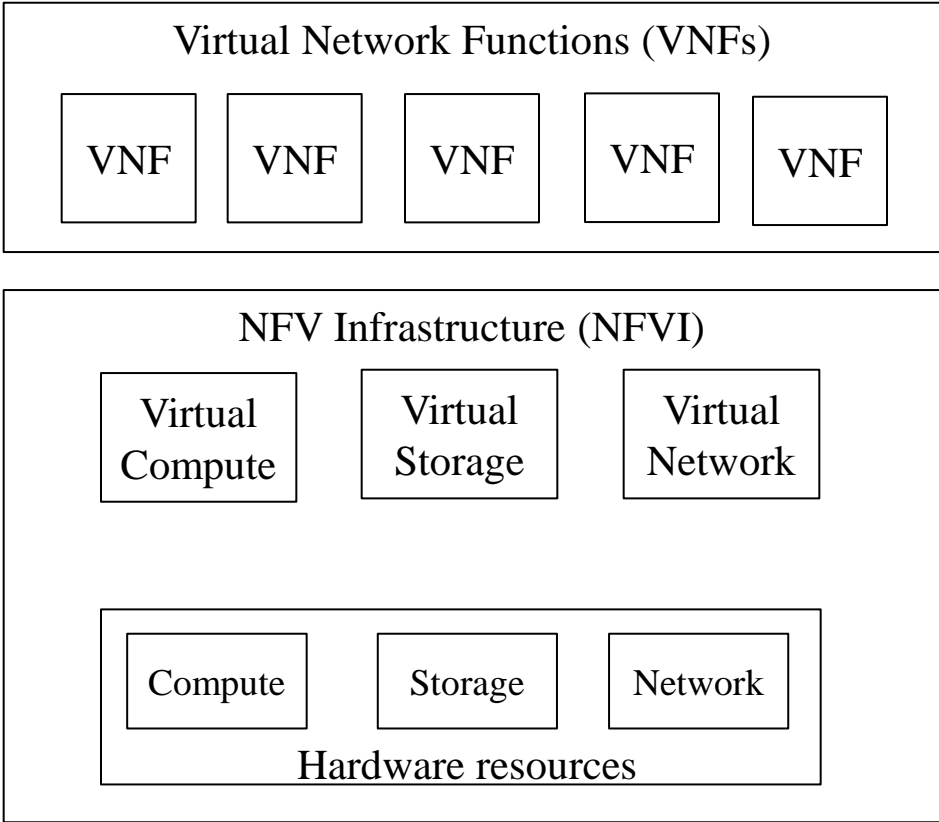

*source : ETSI

Architecture of network virtualization

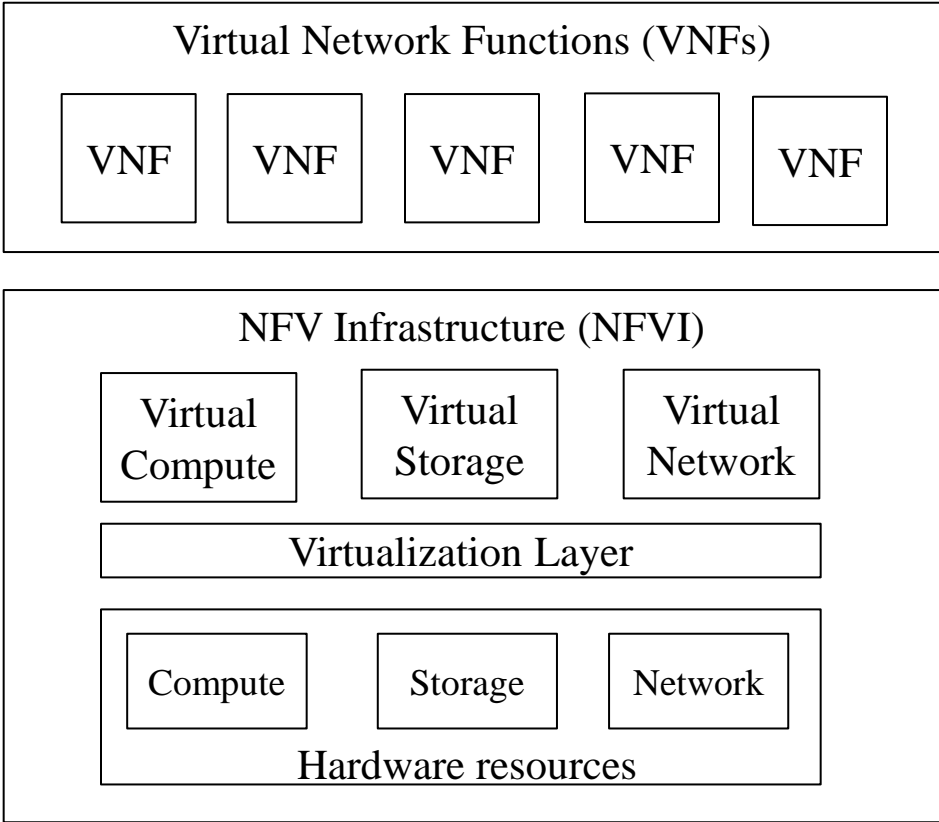

*source : ETSI

Architecture of network virtualization

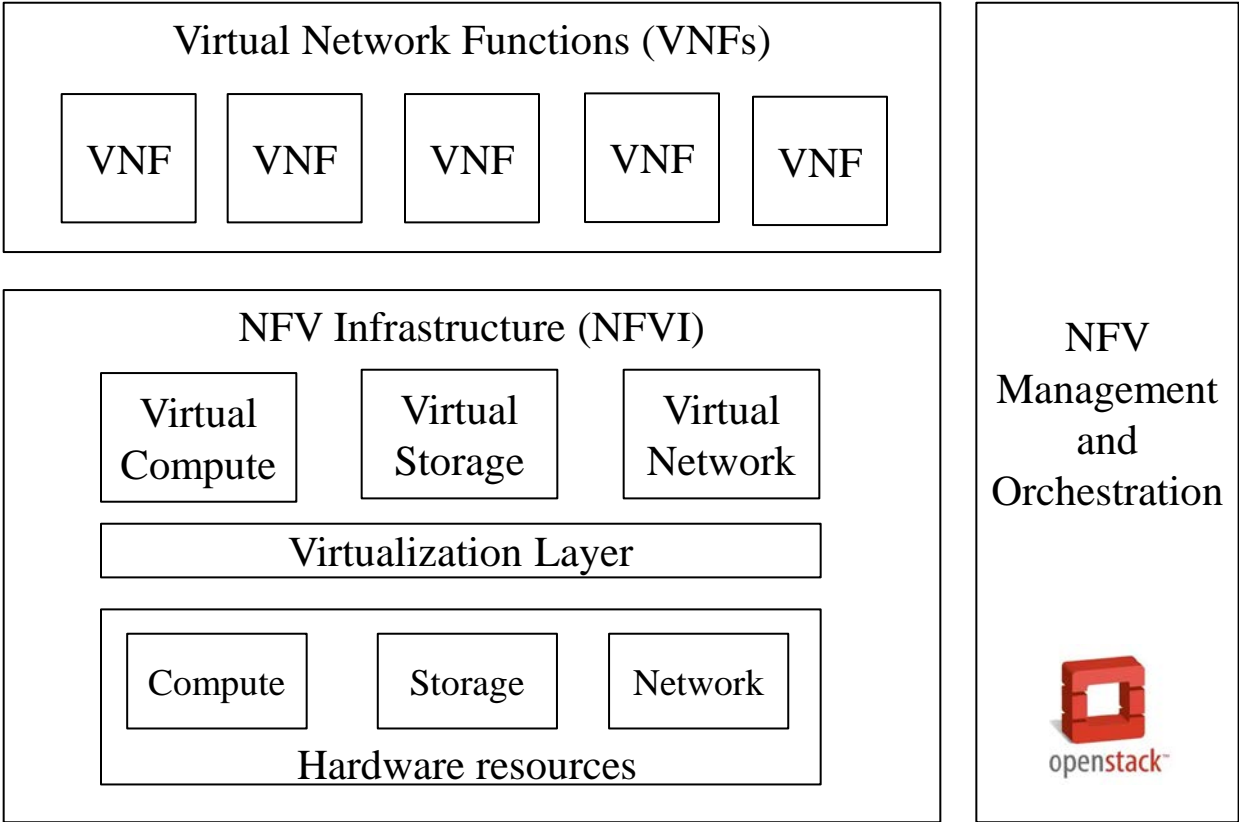

*source : ETSI

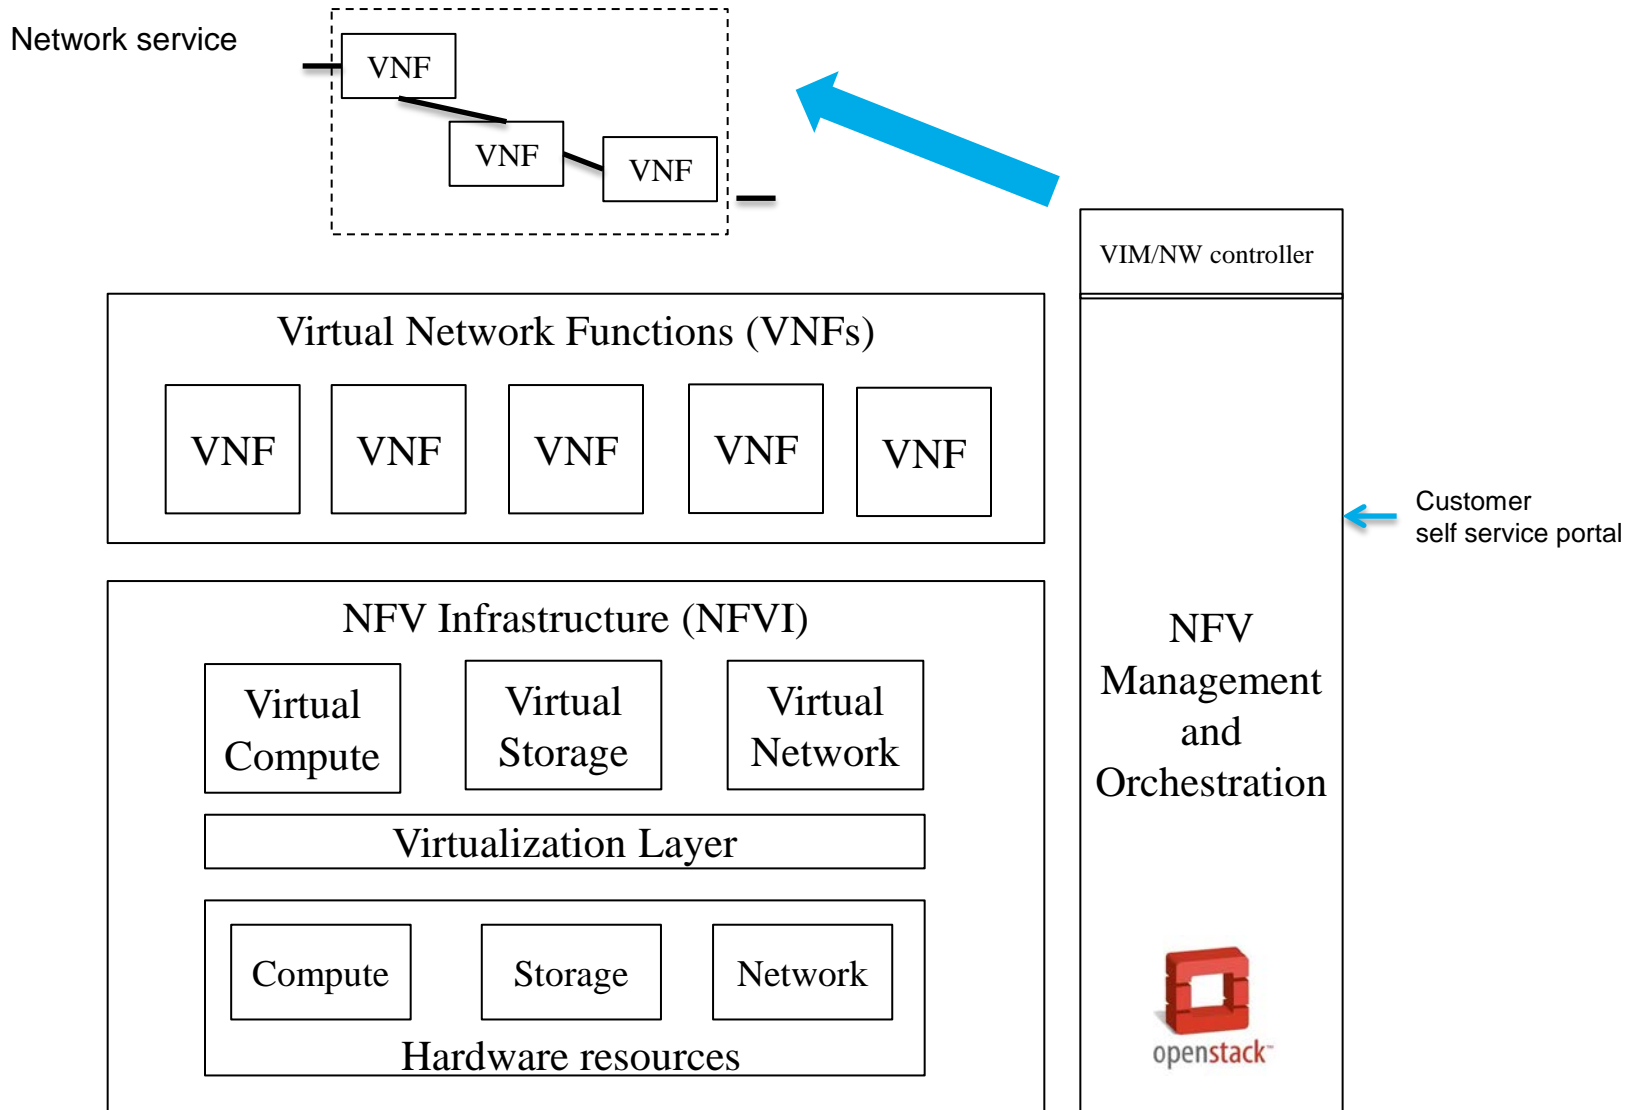

Architecture of network virtualization

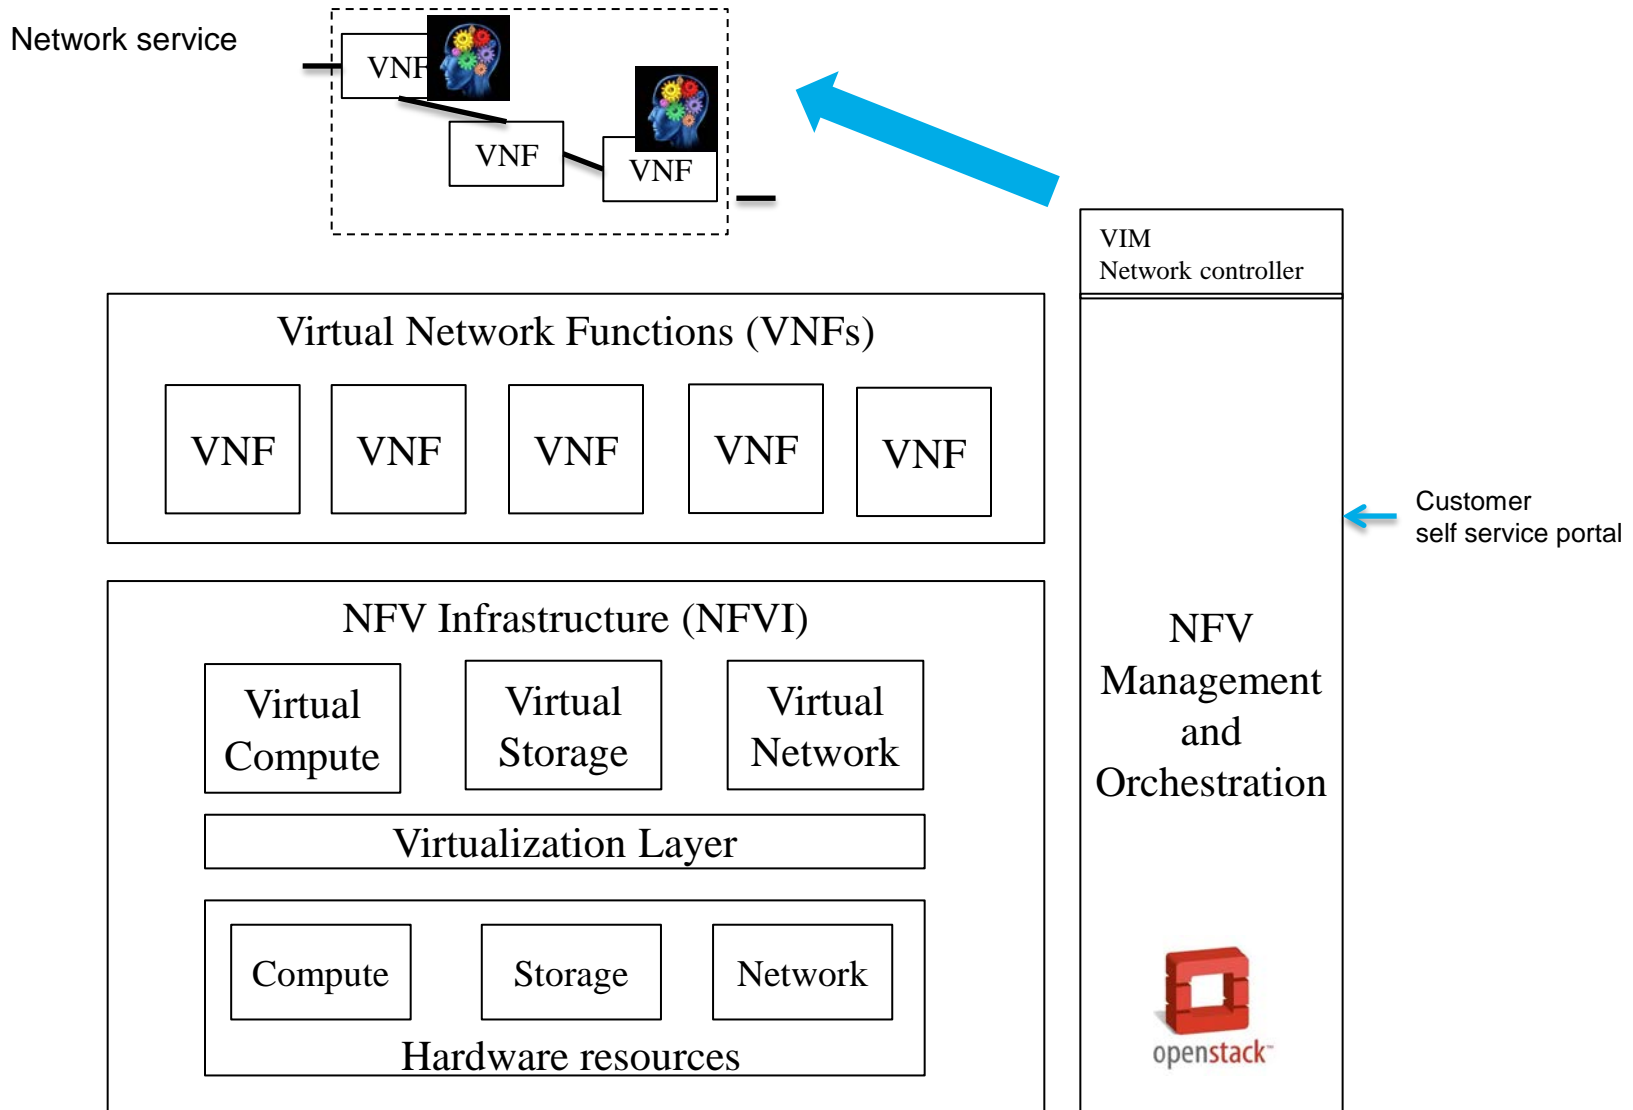

*source : ETSI

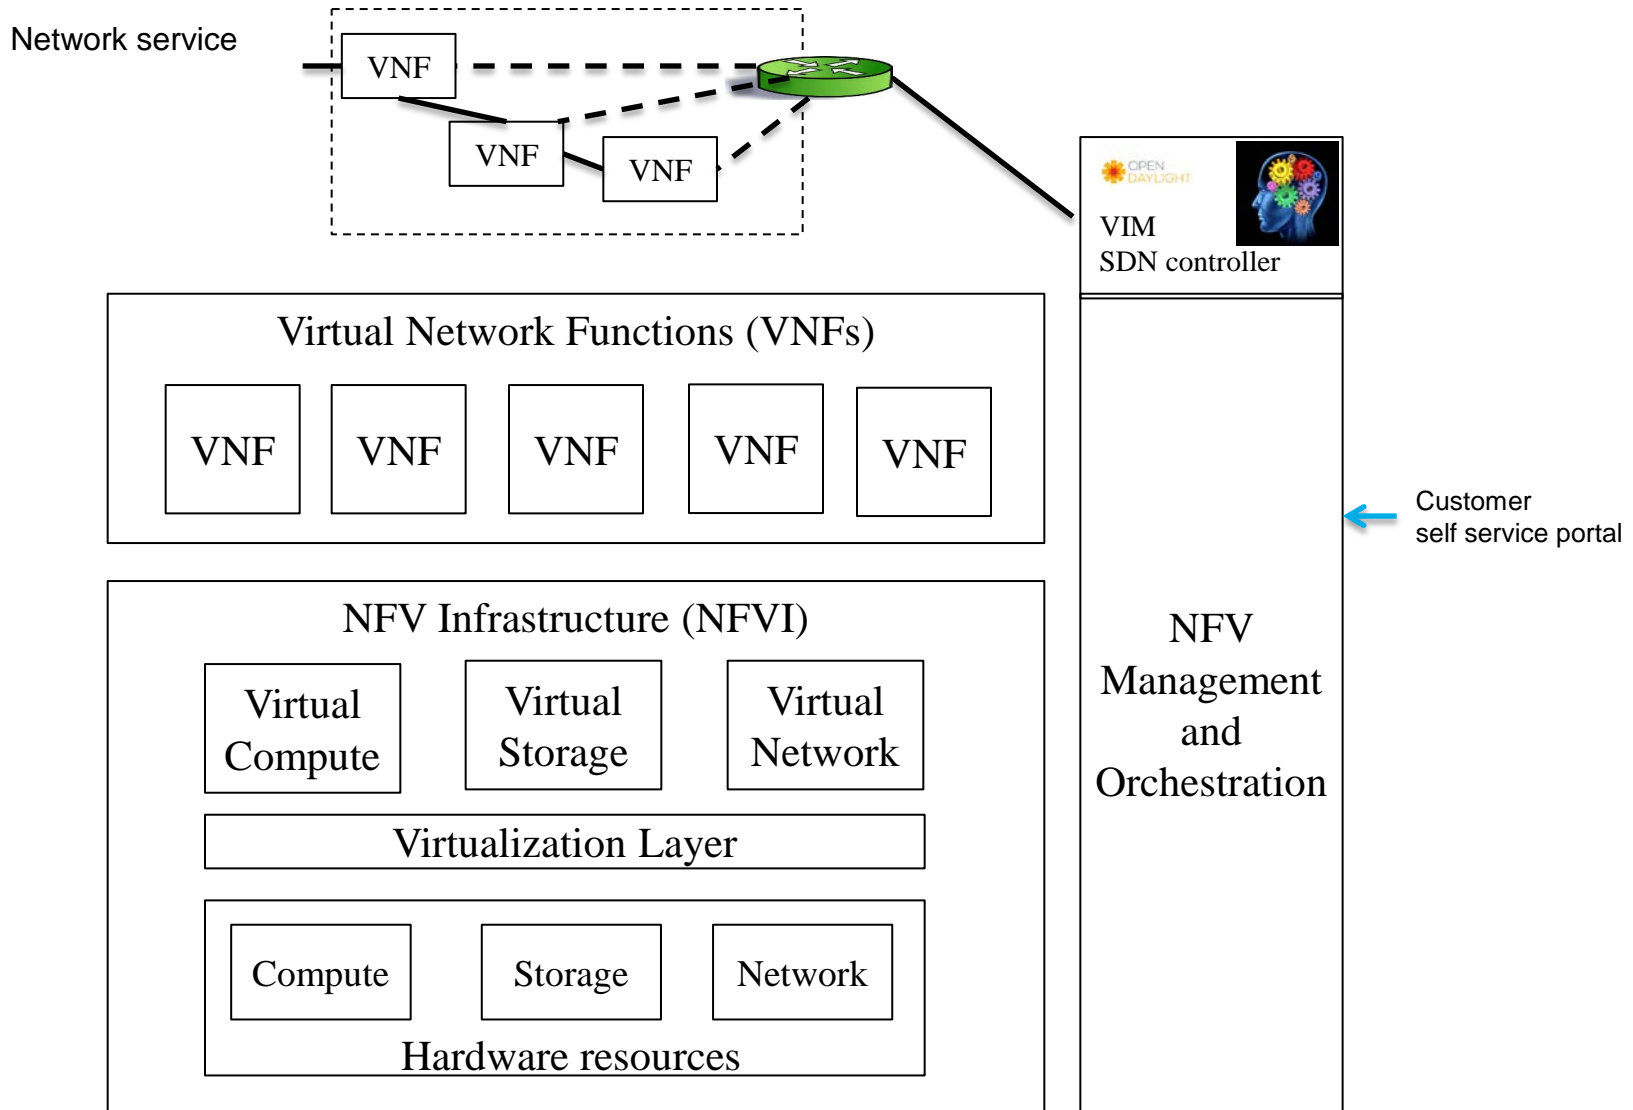

Architecture of network virtualization

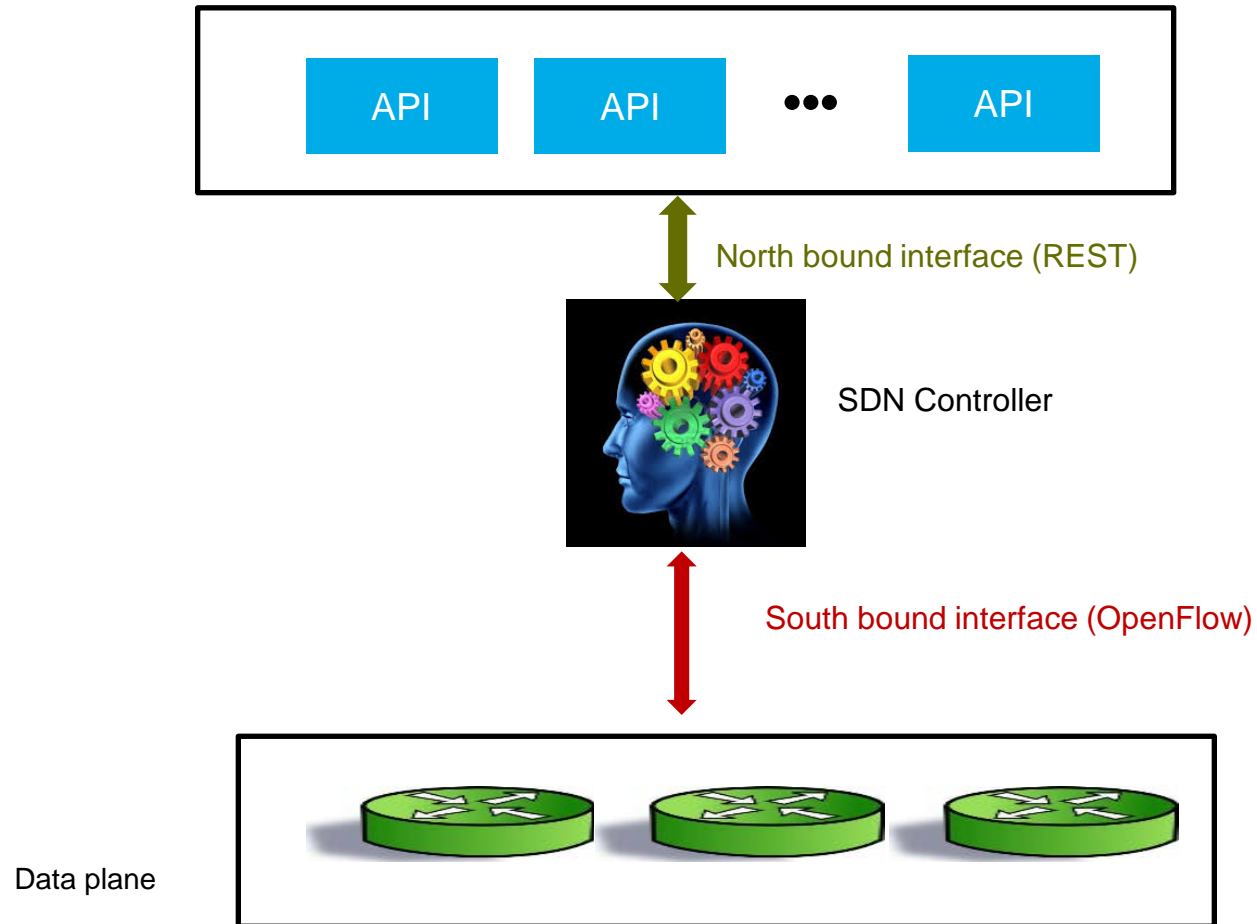

One of the ways to control the network ?

SDN : One of the ways to control the network

Enabler: Software Defined Networking (SDN)

Separate the data plane and the control plane

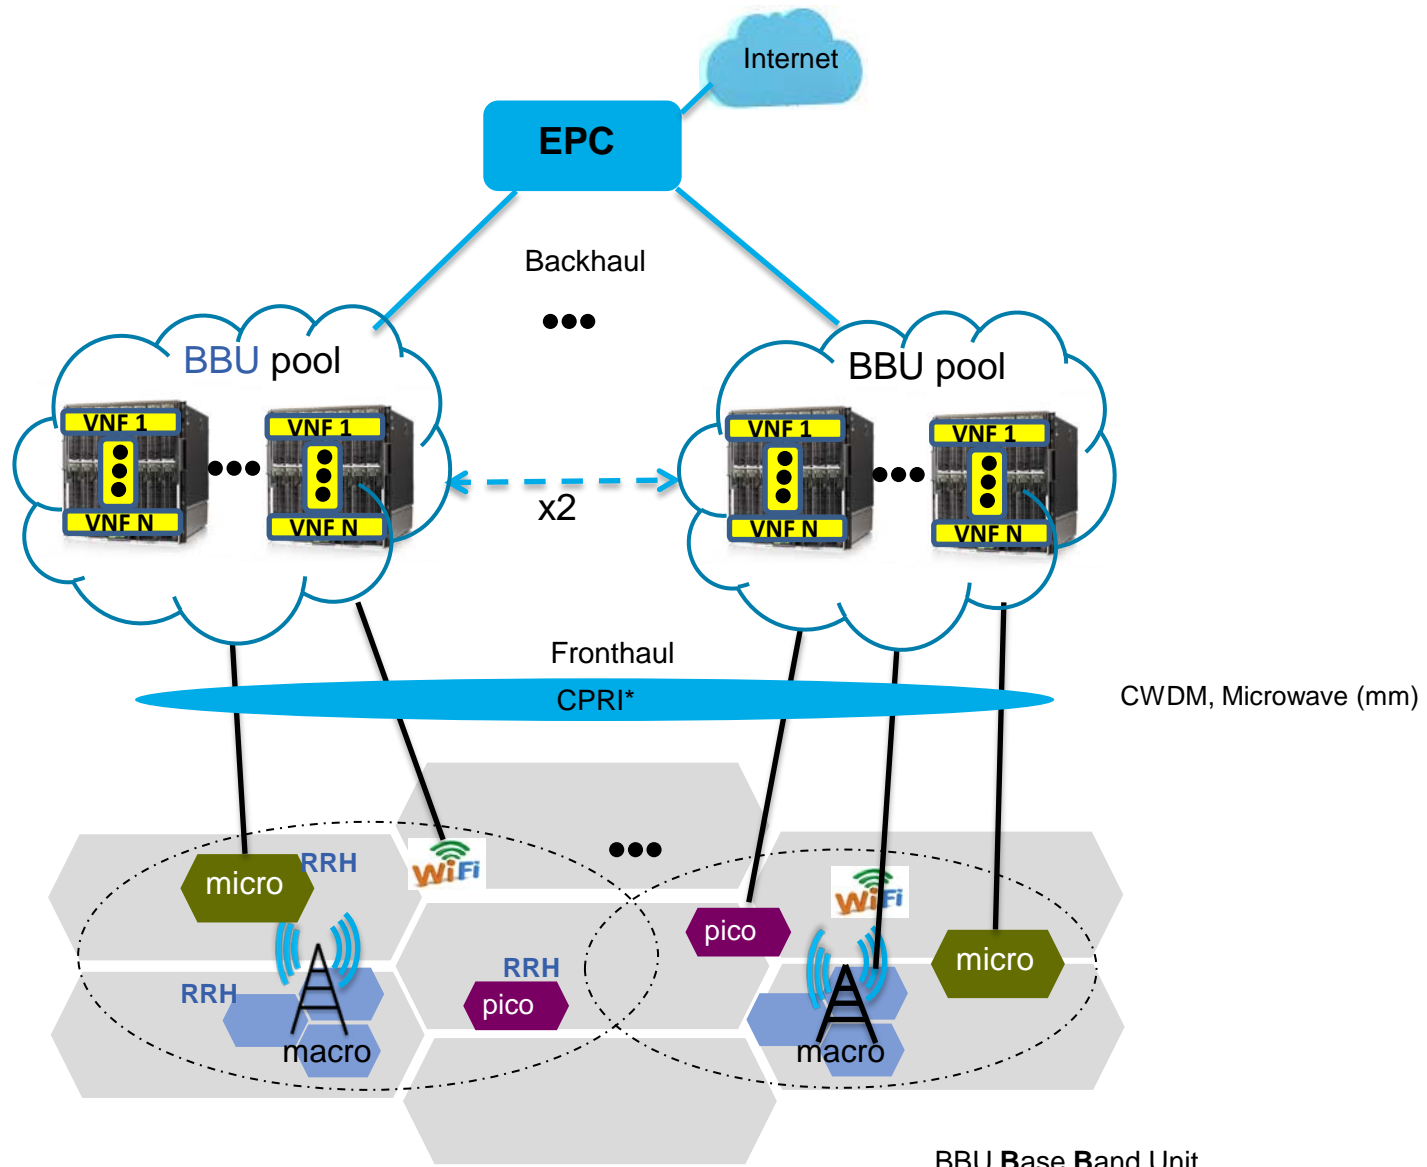

SDN at work !

- Speaking at the Open Networking Summit in April 2012, Urs Holzle, senior vice-president of technical infrastructure at Google said
- “The **company can now prioritize certain traffic**, such as Gmail backups, to ensure they get through in a timely manner”
- Perhaps most impressively, Holzle told the conference that, “**in using SDN** to intelligently manage the flow of traffic through its internal network, **Google will eventually hit 100% network utilization**. In an industry where 30% to 40% is considered standard, that is a huge performance increase.”

Outline

- Challenges → What is coming
- The Network of today
- Elastic Networks → Way forward
- Enablers for Elastic networks → NFV / SDN
- **Use cases**
 - vCRAN
 - vEPC
 - vCDN
- Conclusion and Outlook

vCRAN

BBU **B**ase **B**and Unit
RRH **R**emote **R**adio **H**ead
CPRI **C**ommon **P**ublic **R**adio **I**nterface

vCRAN → Why

- A generic network, supporting different tech 3G, WiFi, 4G, XG and different applications
- Allocating spectrum resources dynamically

vCRAN → Why

- A generic network, supporting different tech 3G, WiFi, 4G, XG and different applications
- Allocating spectrum resources dynamically

- LTE-A will use

- network MIMO
- coordinated scheduling
- Interference management

vCRAN → Why

- A generic network, supporting different tech 3G, WiFi, 4G, XG and different applications
- Allocating spectrum resources dynamically

- LTE-A will use

- network MIMO
- coordinated scheduling
- Interference management

} **CRAN**

- Liberty of using the slice specific to the type of application and technology

vCRAN → Why

- A generic network, supporting different tech 3G, WiFi, 4G, XG and different applications
- Allocating spectrum resources dynamically

- LTE-A will use

- network MIMO
- coordinated scheduling
- Interference management

} **CRAN**

- Liberty of using the slice specific to the type of application and technology

- RAN sharing

- Active → Only cell sites
- Passive → In addition to cell sites radio spectrum and baseband processing unit is shared

vCRAN → Why

- A generic network, supporting different tech 3G, WiFi, 4G, XG and different applications
- Allocating spectrum resources dynamically

- LTE-A will use

- network MIMO
- coordinated scheduling
- Interference management

- Liberty of using the slice specific to the type of application and technology

- RAN sharing

- Active → Only cell sites
- Passive → In addition to cell sites radio spectrum and baseband processing unit is shared

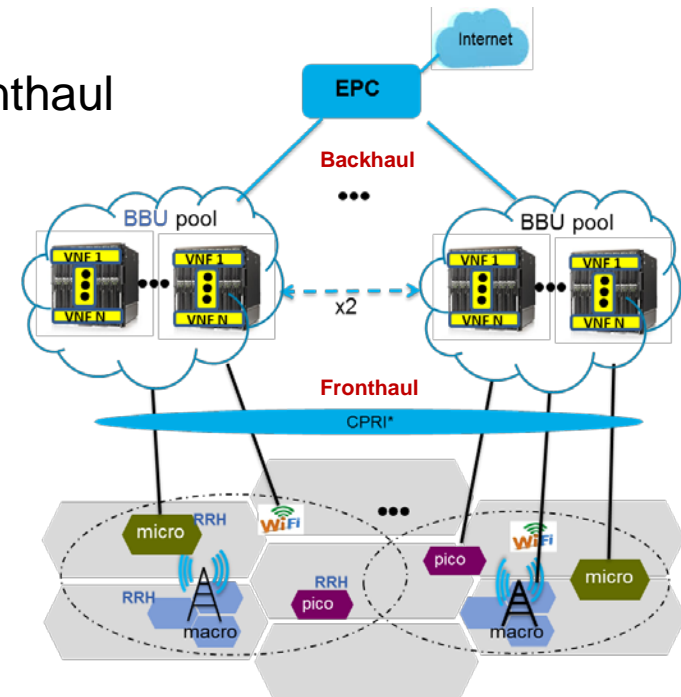

- Age old algorithms on user mobility and traffic patterns can be put into practice

- leveraging global view and efficient monitoring tools of SDN

- CRAN → Green RAN

vCRAN, Challenges

- For centralized CRAN architecture
 - High BW requirement to carry baseband I/Q between BBU and RRH
- Fairness in power, spectrum or product of two
- Fully centralized architecture: requires high capacity fronthaul
- Integration with backhaul.
- CPRI → CWDM, Microwave ?
- Coordination
- Low latency and near zero jitter
- Virtualized solution vs DSP

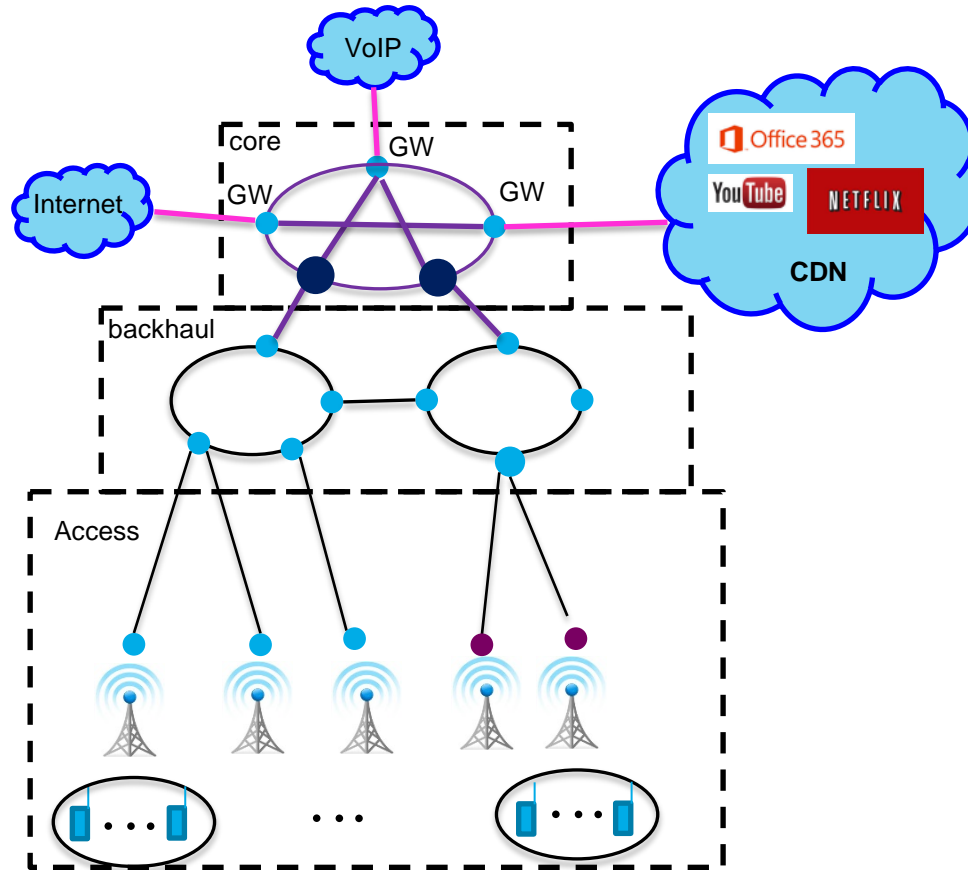

Outline

- Challenges → What is coming
- The Network of today
- Elastic Networks → Way forward
- Enablers for Elastic networks → NFV / SDN
- **Use cases**
 - vCRAN
 - vEPC
 - vCDN
- Conclusion and Outlook

vEPC

vCDN

vCDN

In a Nutshell

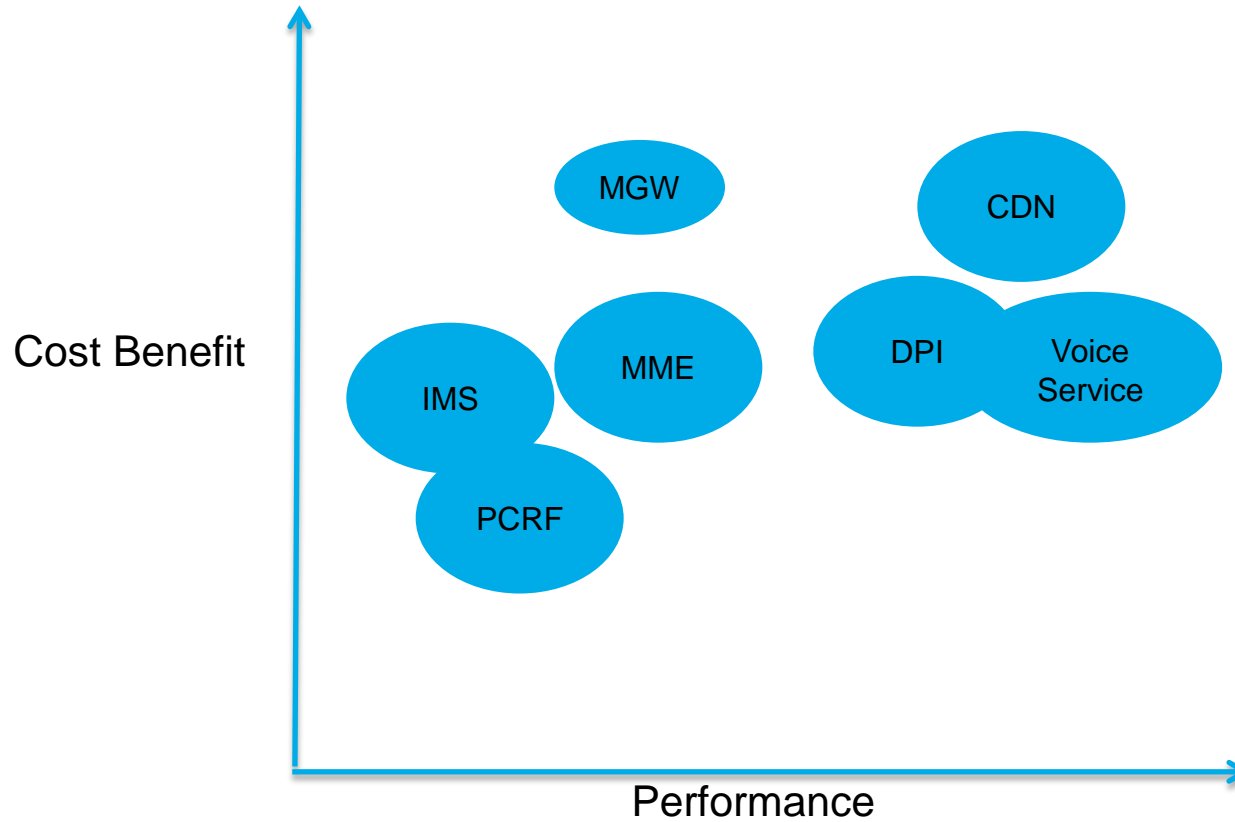

- Reduction in CAPEX and OPEX.
 - Cost effective → Commodity hardware a plentiful and scalable resource.
- Address new requirements through new software not new equipment.
 - Fast service delivery
 - Bandwidth on demand services
- Integrated RAN → Each slice for different traffic type and technology. Selected by SDN controller. The slice can be scaled up/down → NFV
- Resource pool in the cloud on VMs → NFV
- New abstraction view of networks possible ~ courtesy SDN

■ Challenge: Cost and Performance analysis of virtualizing network functions

Cost and Performance Analysis : Expected Outcome

Contributors 

Performance Analysis

Low level variable	Description	Strategic Results variable
Link utilization	Percentage of total link utilization between two points in the network. VNFs can be located at different locations in the network → Impacts link utilization.	Cost, performance
Resource utilization	NFV has the potential to reduce resource utilization since multiple VNFs can be installed on COTS hardware. How will the virtualisation of the function impact utilization of the hardware, i.e. router, switches, servers and storage?	Cost, performance
Energy consumption	Can be reduced by consolidating equipment and exploit power management features in standard servers and storage, as well as workload consolidation and location optimization.	Cost, performance
